A brief review is given of the vessels which participated in the SAE during the period. Sizes, types, cargo and passenger capacities, speeds, ranges, bunker capacities, and displacements are given for the *Ob', Michael Somov, Professor Vise,* and *Elbrus.* Their methods of operation are described as they remanned and resupplied the Russian antarctic stations: Molodezhnaya, Mirny, Russkaya, Novolazarevskaya, Bellingshausen, and Leningradskaya.

Aver'ianov, V.G., Klokov, V.D., Alekhin, A.N., **Air navigation support for scheduled flights of IL-18 aeroplanes to Molodezhnaya Station,** Symposium on Antarctic Logistics, 3rd, Leningrad, 1982. Proceedings, Scientific Committee on Antarctic Research, [1983], p.99-105.

A detailed description is given of the construction of the snow runway at Molodezhnaya Station in 1980. During the pre-construction phase three major technical problems had to be resolved: understanding of the mass-energy exchange on the ice and in the snow-firn; increasing the bearing capacity of the snow; development of working techniques for the construction phase. When these had been resolved a runway suitable for IL-18 operations into the station was realized.

Kusunoki, K., **Japanese icebreaker *Shirase*,** Symposium on Antarctic Logistics, 3rd, Leningrad, 1982. Proceedings, Scientific Committee on Antarctic Research, [1983], p.119-126.

In April 1979 the Japanese Government decided to build a new icebreaker (Arctic Class 4) to replace the icebreaker *Fuji* which was built in 1965. The new ship *Shirase* will carry personnel, cargo, helicopters, and provide for onboard observations. The standard displacement is 11,000 tons, and the propulsion capacity of 30,000 SHP is provided by six sets of generators and motors which drive three propellers through three shafts. Accommodation for 60 scientists plus 170 crew and capacity for a cargo of 1,000 tons are provided. Laboratories for the onboard research of upper atmosphere physics, oceanography, biology, geosciences and gravimetry and a data processing room are also provided. She will be commissioned in the 1983/84 season. (Auth.)

Carvajal, E.M., **C130 and DHC5 air drops in Antarctica,** Symposium on Antarctic Logistics, 3rd, Leningrad, 1982. Proceedings, Scientific Committee on Antarctic Research, [1983], p.142-143.

Air operations in support of the Chilean station on the eastern side of Adelaide Island just south of the Antarctic Circle are briefly described. Types of aircraft involved and the materiel transported are noted and details of air drop procedures are included.

G-31533

Carvajal, E.M., **Runway at Rodolfo Marsh Martin Station,** Symposium on Antarctic Logistics, 3rd, Leningrad, 1982. Proceedings, Scientific Committee on Antarctic Research, [1983], p.144-155.

Details are given of the site selection and construction of the airfield on Fildes Peninsula on King George Island. The complex is composed of the runway, hangar, and the air terminal and guest house. The runway, oriented ESE-WNW (110-290), is 1,305 m long with expansion capability to 1,600 m if necessary. Radio navigational aids include radio beacon, VOR/DME, and radio beacon finder. Diagrams are included of the air approach patterns using these aids. Sketches are also included of the other airfield facilities.

G-31534

Alarcon, B., Marangunic, C., Villanueva, V., **Preliminary studies for the project of a landing strip at Capitan Arturo Prat Base, Greenwich Island,** Symposium on Antarctic Logistics, 3rd, Leningrad, 1982. Proceedings, Scientific Committee on Antarctic Research, [1983], p.156-194, 6 refs.

This paper shows the preliminary work and geotechnical studies for the design and development of an airstrip in support of Chilean antarctic research. Geotechnical studies show a favorable terrain formed by terraces and littoral berms, with a minor proportion of intermediate to basaltic andesite rocks. Complementary analysis of photointerpretation was made on aerial photographs obtained in February 1980. By conventional aerophotogrammetric methods, the necessary information was obtained for the design of the runway. The scale 1:4,000 allowed conforming to technical specifications for airport Code C-D, according to norms Annex 14 OACI. In the field an axis of 1,230 m was staked off with sufficient room for lengthening to 1,430 m. Complementary studies of the mechanics of ice resistance for skiways were also made. (Auth. mod.)

G-31536

Clark, N., **Motorized toboggans,** Symposium on Antarctic Logistics, 3rd, Leningrad, 1982. Proceedings, Scientific Committee on Antarctic Research, [1983], p.200-205.

The New Zealand experience with this type vehicle is described and an evaluation of the types used is given. During the period from 1969-1974 the three toboggan types used were: Sno-tric (Sweden); OMC Snow Cruiser B (Canada); and Rupp 440 Snowmobile (US). These are compared and performance assessments are given.

Gosbell, K.B., Holmes, I.E.B., **Rebuilding of Australia's 3 antarctic stations, Parts 1-3,** Symposium on Antarctic Logistics, 3rd, Leningrad, 1982. Proceedings, Scientific Committee on Antarctic Research, [1983], p.214-273.

A rebuilding program to redevelop the Mawson, Davis and Casey stations is presented in three parts. Basic requirements are outlined, and the underlying concepts behind the master planning of each station are described, in part one. The building system is covered in part two, and the engineering services in part three. Details of the new construction are given along with the rationale for building placement on the sites taking into consideration prevailing wind direction, snow drifting, protection of personnel and buildings against 100+k winds. Differences in construction between the stations are pointed out. Problem areas in the earlier construction are rectified in the plans for the new buildings. Comparisons between the old and the new are facilitated by the photographs included.

Mannhardt, S., **Technical concepts of the antarctic stations Georg-Von-Neumayer and Filchner of the Federal Republic of Germany,** Symposium on Antarctic Logistics, 3rd, Leningrad, 1982. Proceedings, Scientific Committee on Antarctic Research, [1983], p.338-347.

The design of the Georg-Von-Neumayer Station provided for container-type buildings, which are protected against direct climatic effects by tubes consisting of corrugated steel sheets. The two tubes, of which the station consists, are described and the layout is illustrated. Described are also the systems providing such services as power and energy, heating, ventilation, water supply and refuse disposal. The communication equipment is listed, as are safety concepts and installations. At the Filchner Station, seven 20-foot Isonorm containers have been built on a steel structure, consisting of a 25-ton grid pillared platform, as living and research facilities for 15 persons, as were two 10-foot containers for energy supply and snow melting plant.

Varcoe, G., **Reverse osmosis hyperfiltration water plant installation, Scott Base,** Symposium on Antarctic Logistics, 3rd, Leningrad, 1982. Proceedings, Scientific Committee on Antarctic Research, [1983], p.390-398.

In order to considerably reduce and possibly eliminate the use of an ice melter for providing the base with fresh water, a reverse osmosis hyperfiltration water plant, model DDS RO HF30 with a capacity of 8,000 liters per hour was installed in the new powerhouse during the 1978/79 season. The RO plant was manufactured by De Danske Sukkerfabrikker of Denmark. Subsequent failure to operate to specification has persuaded the manufacturer to replace the original plant and the modified version is scheduled for installation during the 1982/83 season. This paper documents the problems experienced with the initial plant. (Auth.)

G-31552

Varcoe, G., **Scott Base rebuilding programme,** Symposium on Antarctic Logistics, 3rd, Leningrad, 1982. Proceedings, Scientific Committee on Antarctic Research, [1983], p.399-405.

Due to recognition of the need to replace the original buildings with a larger, more modern complex, embodying new technologies and facilities necessary to the efficient running of a continuously manned station, reconstruction of Scott Base was commenced in 1976 and is scheduled for completion in the mid 1980s. The new base will provide a living and work area of 2,018 sq. meters, which is approximately three times the size of the original base. Against a background of valuable experience gained from operating and maintaining the original base over a period of twenty years, this paper describes the staged development of the new base rebuilding program. (Auth. mod.)

Jezek, K.C., **Radar measurements of borehole geometry on the Greenland and Antarctic ice sheets,** *Geophysics,* MP 1860, Feb. 1985 50(2), p.242-251, 12 refs.

A method for measuring the geometry of boreholes in glaciers has been developed and tested in Greenland and Antarctica. Coordinates of points along the borehole are determined by lowering a passive radar target into the borehole and then tracking the target from three surface stations. Comparison of geometry interpreted from radar data and from a conventional inclinometry experiment indicates that radar data can be used to estimate average borehole inclination and azimuth but cannot be used to measure details of the borehole geometry that are revealed by conventional inclinometry surveys. Random error introduced by variations in the physical properties of the glacier and electrical noise in the radar unit limit measurement accuracy, but the accuracy can be improved by establishing additional surface radar stations around the borehole. These experiments demonstrate the utility of the radar method and suggest the possibility of deploying permanently installed radar targets in ice sheets to measure intraglacial movements. (Auth.)

Schmid, R., **Antarctic exploration by airplane** [Antarktis-Forschung mit Flugzeugen], *Naturwissenschaftliche Rundschau,* Mar. 1985 38(3), p.102-104, In German.

A brief review is given of the history of antarctic exploration and research and of German use of aircraft in the low temperatures and high winds of Antarctica. A renewed German interest in Antarctica in the 1980s manifested itself in the establishment of a year round station (Georg von Neumayer) and a major summer station on the Filchner Ice Shelf. The stations are supported by two aircraft: the smaller designed for logistics use as personnel and equipment transport to and from summer field camps. The larger craft is equipped and instrumented for aerial research projects. Both planes have the capability for long range flights between Bremerhaven and Antarctica.

Bianchi, R.A., Piezzi, R.S., Bernaldez, J., **Metabolic variations of 5-Hydroxindolacetic acid (5-HIAA) and vanillin mandelic acid (VMA) in the stable population of Belgrano Station** [Variaciones metabólicas del ácido 5-hidroxindolacetico (5-HIAA) y vainillin mandelico (VMA), en la población estable de la Base Gral. Belgrano], *Buenos Aires. Instituto Antártico Argentino. Contribución,* 1983 No.283, 11p., In Spanish with English, French and German summaries. 21 refs.

Isolation effects on urinary elimination of 5-HIAA and VMA were studies in 22 individuals from Belgrano Station during 1978. Significantly increased excretion of the total 5-Hydroxindoles during the four sampling periods (February, May, August, December) was found. Significant changes in the VMA excretion were not observed. These results are discussed in relation to some of the symptoms of the antarctic syndrome, specially sleep disturbances. (Auth.)

Evdokimov, V.V., Petrosov, V.V., Skvortsov, V.T., **Level of normal antibodies and immunoglobulins in human serum under extreme conditions in Antarctica** [Uroven' normal'nykh antitel i immunoglobulinov v syvorotke cheloveka v ekstremal'nykh usloviiakh Antarktidy], *Zhurnal mikrobiologii, epidemiologii i immunobiologii,* Apr. 1983 No.4, p.106-109, In Russian with English summary. 15 refs.

The sera of 27 polar explorers wintering at the Vostok Station were studied. The dynamics of normal antibodies, correlating with the immunoglobulin level in the sera, were observed. The observation revealed that the development of changes in the content of immunoglobulins of different classes started at different times. The authors suggest that a common mechanism is responsible for the synthesis of nonspecific immunoglobulins and normal antibodies, the latter indicating the level of natural resistance to the action of various environmental factors. (Auth.)

Panin, L.E., **Some theoretical and application problems in human adaptation to high latitudes** [Nekotorye teoreticheskie i prikladnye voprosy adaptatsii cheloveka v vysokikh shirotakh], Problemy ekologii poliarnykh oblasteĭ (Problems of ecology in polar regions) edited by G.V. Voropaev, Moscow, Nauka, 1983, p.45-59, In Russian. 9 refs.

Changes in chemical composition of human blood under high latitude conditions were studied in Antarctica, the Arctic and different climatic-geographic regions of Siberia. Media optimizing the variations of physiologic processes are discussed and the behavior of certain substances in blood of the Antarctic and Arctic inhabitants compared. Suggestions are made concerning the hygienic requirements and dietetic needs of people residing under extreme climatic conditions of the regions described.

Parkinson, A.J., Muchmore, H.G., Scott, E.N., Scott, L.V., **Survival of human parainfluenza viruses in the South Polar environment,** *Applied and environmental microbiology,* Oct. 1983 46(4), p.901-905, 15 refs.

The survival of human parainfluenza virus types 1, 2, and 3 was measured in both indoor and outdoor environments at South Pole Station, Antarctica, in an effort to determine the long-term survival of these viruses in this environment and to identify the possible source of respiratory tract illnesses which occurred in this population in 1978 after 10 and 27 weeks of total social isolation. Viruses were applied to plastic petri plate surfaces which were then stored in indoor and outdoor environments. Parainfluenza virus type 1 was inactivated after 4 days at room temperature and after 7 days outside. Parainfluenza virus type 2 and 3 were inactivated after 7 and 12 days, respectively, at room temperature and after 17 days of storage outside. Results indicate that the long-term survival of parainfluenza virus in either environment for up to 10 weeks is unlikely and probably did not provide the source of infectious virus responsible for the mid-isolation outbreaks of parainfluenza virus-related respiratory tract illnesses observed in this population during the 1978 winter season. Norris, J., **"Scurvy disposition": heavy exertion as an exacerbating influence on scurvy in modern times,** *Bulletin of the history of medicine,* Fall 1983 57(3), p.325-338, 42 refs.

Ascorbic acid metabolism in man, and diagnosis, pathology, etiology and treatment of scurvy are discussed in connection with the high incidence of the disease in polar expeditions—such as Scott's Expeditions to the Antarctic, for example—and in seamen exposed to cold and hard life and stress of travel. Distances, days, loads and scurvy occurrence of four antarctic expeditions are tabulated, as are estimates of vitamin C content in base rations and sledge rations of various polar expeditions.

Varela de Rodríguez, J.E., **Appraisal of the hypophysis function under cold stress conditions** [Valoración de la función hipofisaria frente al stress de frio], *Buenos Aires. Instituto Antártico Argentino. Contribución,* 1983 No.304, 9+12p., In Spanish and English. 13 refs.

The influence of exposure to antarctic conditions on a group of three men at Brown Station was studied. In basal samples (BS), and samples obtained under cold stress, prolactin (Pr), luteinizing hormone (LH), follicle-stimulating hormone (FSH), thyrotrophic hormone (TSH), somatotrophic hormone (STH), thyroxine (T4), triiodotironine (T3) and cortisol were determined in plasma. Electrocardiograms and body temperatures were registered. An alteration in diurnal rhythms of Pr and cortisol, as well as accelerated heartbeat were found, and some subjects showed low axilary temperatures under stress conditions. BS values were similar to those found in Buenos Aires, except for LH data, which were lower. It is concluded that the degree of stress in this group was sufficient to alter circadian Pr and cortisol rhythms but that the stress was not sufficient to increase hormonal values in plasma above normal. Muchmore, H.G., Parkinson, A.J., Scott, E.N., **Respiratory virus infections during the winter at the South Pole,** *Antarctic journal of the United States,* 1983 18(5), p.229-230, 8 refs.

The problem of common colds occurring at South Pole Station during the middle of the isolation period, long after the accepted incubation period for human common cold viruses and when the introduction of new virus to the community was impossible, is addressed. During the 1974 and 1975 winters throat swabs were collected from subjects, but no virus was isolated. Again during winter 1976 no virus was grown, but the results suggest that parainfluenzaviruses were responsible for the mid-isolation colds. Parainfluenzaviruses 1 and 3 were also recovered from the mid isolation community during 1978. None were detectable in 1977 wintering subjects. During the 1981 winter a rhinovirus was obtained from a symptomatic subject and in 1982 colds were accompanied by nonbacterial gastroenteritis. The presence of these viruses in the South Pole Station community after more than 10 weeks of total isolation suggests their long-term persistence either in the environment or in one or more subjects. The results also suggest that more than one virus may be involved in the etiology of mid-winter common-cold episodes.

Parkinson, A.J., Scott, E.N., Muchmore, H.G., Kalmakoff, J., **Decline in parainfluenzavirus specific antibody avidity preceding common cold during isolation at the South Pole,** *Antarctic journal of the United States,* 1983 18(5), p.231-232, 3 refs.

In the work reported here, an attempt is made to show that quantitative changes in the virus-specific antibody binding (antibody avidity) can be measured, and that this antibody avidity may be useful as an indicator of susceptibility to infection in man. Low mean virus-specific antibody avidity was demonstrated in this population coinciding with both the midwinter outbreaks of common colds which occurred in 8 out of 22 subjects in Apr. 1978 after 10 weeks' isolation, and also in Aug. 1978 after 27 weeks of isolation. These quantitative decreases in the antibody avidity levels, and subsequent common-cold outbreaks suggest that when the antibody avidity level for the whole group falls below a certain threshold level, virus carriers previously dormant might then become active as the source of new clinical and subclinical infections within this closed community. This study suggests that high serum antibody avidity is important in maintaining immunological resistance to respiratory parainfluenzavirus infections in man.

Meschievitz, C.K., Raynor, W.J., Dick, E.C., Mandel, A.D., **Cold severity, duration, and epidemiology in persons emerging from isolation compared to newly arrived persons at McMurdo Station,** *Antarctic journal of the United States,* 1983 18(5), p.232-234, 4 refs.

A common cold study of 191 winterover personnel emerging from six months' isolation compared to 408 newly arrived summer personnel failed to support the widely accepted theory of increased severity of and enhanced susceptibility to respiratory disease among isolated persons. The men in these groups were of similar age and ethnicity and lived together at McMurdo Station between late August and early October in 1975, 1976 and 1977. No significant differences were found between the two groups in symptom severity scores or cold duration and similar susceptibility was suggested from Antarctic cold incidence and period prevalence.

Moshkin, M.P., **Effect of natural light regime on biorhythm in polar personnel** [Vliianie estestvennogo svetovogo rezhima na bioritmy u poliarnikov], *Fiziologiia cheloveka,* Jan.-Feb. 1984 10(1), p.126-129, In Russian. 20 refs.

Study of members of the 19th Soviet Antarctic Expedition showed changes in the circadian rhythms of body temperature, myocardial contractility, diastolic pressure, and excretion of 17-ketogenic steroids and 17-ketosteroids with decreased brightness on cloudy days. Similar effects are seen during the period of polar darkness. The rhythms of other physiologic functions did not react to changes in the light regime, or reacted differently to the reduction in natural light during polar darkness and to the reduced light in the fall. The physiological processes whose circadian rhythms were a function of the light regime were directly or indirectly linked to the regulatory action of neuroendocrine structures.

Barabasz, A.F., **Antarctic isolation and imaginative involvement. Preliminary findings,** *International journal of clinical and experimental hypnosis,* July 1984 32(3), p.296-300, 13 refs.

Nine subjects (Group 1) were interviewed in Antarctica prior to and following 1 year of Antarctic isolation. Group 2 subjects were exposed to 3 weeks of antarctic field-site isolation and were interviewed upon return to the United States. A control group of 10 subjects was also interviewed on 2 occasions, paralleling Group 1. Group 1 showed a significant increase in imaginative involvement from pre- to post-Antarctic isolation. Group 2 showed a significantly greater level of imaginative involvement than the control subjects. The possibility that living in the Antarctic may have revived the mental processes available to these subjects as children is considered within both regression and learning explanations. (Auth.)

Cazes, G., Crocq, L., Rivolier, J., **Study of the biographic records of subjects wintering in the Antarctic applied to selection** [Etude des antécédents biographiques des sujets hivernant dans l'Antarctique. Application à la sélection], *Revue de psychologie appliquée,* 1984 34(4), p.291-304, In French with English summary. 12 refs.

The aim of the study is to see if significant relation exists between the quality of polar wintering and the past records of the subjects. Two methods of multivariate analysis are applied to 699 biographical and medical questionnaires filled out before departure. To evaluate the field adaptation different controls are used. The results show that the differences between well- and poorly-adapted subjects are more related to socio-professional status than to personality traits. This is corroborated by a clinical study concurrently carried out. A practical purpose is foreseen. (Auth.)

Voskresenskiĭ, A.I., Lysakov, E.P., Sveshnikov, A.M., **Mechanism of energy transformation in the south polar atmosphere** [Mekhanizm preobrazovaniia energii v atmosfere iuzhnoĭ poliarnoĭ oblasti], *Antarktika; doklady komissii,* 1982 No.21, p.5-10, In Russian. 7 refs.

A synoptic study of energy transformation in the south polar atmosphere is reported. Tabulated data shows values for inner, potential and kinetic energy, as well as for latent and sensible heat, measured at different heights and in warm- and cold-front sectors. Synoptic formations are found to be carriers of latent energy of phase transformations in water vapor carried from middle to high latitudes.

I-28966

Lysakov, E.P., **Empirical model of a south polar circulation cell** [Empiricheskaia model' iuzhnopoliarnoĭ tsirkuliatsionnoĭ iacheĭki], *Antarktika; doklady komissii,* 1982 No.21, p.11-18, In Russian. 12 refs.

After many years of atmospheric wind and temperature radio soundings, an analysis is made of the air mass fluctuations over Antarctica. The mean meridional circulation, regulating the air exchange, is quantitatively evaluated. It is shown, by the yearly averages over the coast, that a mass balance is reached between the outflow of continental air in the Earth-600 gp layer and the inflow in the 600-50 gp layer. The theoretical scheme of the circulation over the south polar region is quantitatively confirmed. The compensatory flow of the masses inside the atmospheric column presses downwards; ascending motions prevail over western Antarctica, descending over the eastern portion, with an overall predominance of descent.

Henderson-Sellers, A., Wilson, M.F., **Surface albedo data for climatic modeling,** *Reviews of geophysics and space physics,* Nov. 1983 21(8), p.1743-1778, Refs. p.1775-1778.

The climate system is driven, primarily, by energy absorbed at the surface. Surface albedo sensitivity is incorporated into all types of climate models, and changes can lead to large feedback effects. Alterations in the extent and/or state of the cryosphere and large-scale modification of vegetation cause significant perturbations in climate model results. An improved and agreed surface albedo data set is urgently required for climate modeling. It is likely that the most appropriate means of achieving consistent and credible surface albedos is by using well-designed satellite surveillance to augment global inventories of soils and vegetation. Recommendations are made for the implementation of a new global scale observational program with the aim of providing surface albedo data at an accuracy of 0.05 within 5-10 years. Antarctic regions are tabulated and considered at various stages in the development of the model. (Auth. mod.)

Spekat, A., Fraedrich, K., **Further studies on single station climatology: (iii) Time spectral analysis of Halley Bay (Antarctic) rawinsonde data,** *Contributions to atmospheric physics: Beiträge zur Physik der Atmosphäre,* May 1983 56(2), p.213-220, In English with French and German summaries. 9 refs.

This single station climatology describes seasonal means, variances, covariances, and the spectral transformations of time series of rawinsonde observations at selected sites. Analyses of stations in the western and eastern part of the Eurasian continent and in the north polar region are extended to Halley Bay in the Antarctic. Three time scales of fluctuation intensities appear in Halley Bay rawinsonde data, but only the long (5-10 days) and short (5 days) period disturbances are significant. Short period disturbances in the vicinity of Halley Bay, their amplitudes and phase relationships are discussed in some detail; they can penetrate to the surface, lift the inversion, lead to cloud- and, in summer, to fog formation; furthermore, weaker (stronger) low level winds occur before (after) the passage of the surface trough. Han, Y.-J., Lee, S.-W., **Analysis of monthly mean wind stress over the global ocean,** *Monthly weather review,* Aug. 1983 111(8), p.1554-1566, 24 refs.

The monthly wind stress over the global ocean has been calculated using updated climatological monthly mean wind data. The effect of the variability of the wind has been incorporated by using the wind speed frequency estimated from the observed mean and variance in a Gaussian distribution model. The spatial and temporal data gaps in the high-latitude oceans have been filled with surface winds estimated from the monthly mean geostrophic winds. The calculated stress data have revealed a number of interesting features that were not well resolved in earlier studies. A rapid transition from a winter to summer stress pattern in the north Indian Ocean is especially notable, and large-scale gyral patterns in the Antarctic Ocean and their seasonal variations are now well-defined. The monthly wind-stress curl calculated from the present stress data is in good agreement with earlier calculations, although the present curl field reveals a more detailed structure, especially in high latitudes and in the tropics. Allison, I., Morrissey, J.V., **Automatic weather stations in the Antarctic,** *Australian meteorological magazine,* June 1983 31(2), p.71-76, 6 refs.

Between 1980 and 1982 a number of automatic weather stations was deployed in the Antarctic region by the Antarctic Division, Department of Science and Technology. Data from these platforms are processed via the ARGOS data collection and location system utilizing satellites. Despite some initial problems, the stations have proved most successful with the longest running station having provided over 12 months' data. This paper briefly describes the design and deployment of these observatories, compares data from AWS with that collected manually, and discusses the preliminary data received from the stations. Pomazanova, N.P., Kasich, T.G., Kovalenko, L.A., Lednichenko, V.A., **Characteristics and type designation of atmospheric processes in the antarctic Indian Ocean** [Osobennosti atmosfernykh protsessov i ikh tipizatsiia v antarkticheskoĭ oblasti Indiĭskogo Okeana], Antarkticheskiĭ kril'. Osobennosti raspredeleniia i sreda. Edited by T.G. Liubimova, R.R. Makarov, and E.A. Kamenskaia, Moscow, Legkaia i Pishchevaia Promyshlennost', 1983, p.19-25, In Russian with English summary. 8 refs.

The main characteristics of the atmospheric circulation over the antarctic Indian Ocean are analyzed. To obtain typical diagrams of the three-dimensional circulation of water, synoptic processes were classified in the area of 55-70 S and 20-140 E, on the basis of daily charts of atmospheric surface pressure, in December-March 1968-1972. The main synoptic processes are defined as either a zonal or a meridional type. The latter is divided into five subtypes. An analysis of the recurrence periods, stability and succession of the types involved indicates that synoptic processes vary greatly in the Indian Ocean sector in summer. (Auth.)

Robinson, E., Clark, D., Cronn, D.R., Bamesberger, W.L., **Stratospheric-tropospheric ozone exchange in Antarctica caused by mountain waves,** *Journal of geophysical research,* Dec. 20, 1983 88(C15), p.10,708-10,720, 23 refs.

This study presents results of a NSF C-130 research aircraft flight over the Ellsworth Mountains of Antarctica in December 1978. The aircraft was in the study area for more than 6 hours and flew 14 flight tracks generally parallel to the mountain ridge at 4 primary altitudes between 7.3 and 8.7 km, MSL. Data analyses included horizontal and cross-sectional fields of temperature, potential temperature, ozone, frost point, and wind. The results showed that over the mountain area there was a pattern of changes in theses variables that could be explained by the apparent vertical motion expected to occur in mountain wave situations. In this case there was vertical displacement of air parcels across the tropopause zone that was shown by ozone and potential temperature patterns. In the patterns at various constant levels the measured values appear to be organized into a series of bands or zones characteristic of wave troughs and ridges oriented across the mean wind direction and parallel to the terrain ridges. Ozone flux calculations were made by using concentrations measured in upwind and downwind zones. (Auth. mod.)

Chýlek, P., Ramaswamy, V., Srivastava, V., **Albedo of soot-contaminated snow,** *Journal of geophysical research,* Dec. 20, 1983 88(C15), p.10,837-10,843, 24 refs.

A new model is presented of snow containing impurities (graphitic carbon). Submicron-sized soot particles are supposed to be distributed randomly throughout the volume. Using the mixing rule for a dielectric constant of a composite medium, we calculate the refractive index of a snow-soot mixture. Then we obtain the single scattering albedo and the asymmetry factor. Using the delta-Eddington approximation, the reflectivity (albedo) of a snow layer is determined within a specified wavelength range. The calculated spectral albedos and the deduced amounts of graphitic carbon agree well with field measurements. Data from the South Pole were used in this study.

Nguyen, G.C., Bonsang, [illegible] Gaudry, A., **Role of the ocean in the global atmospheric sulfur cycle,** *Journal of geophysical research,* Dec. 20, 1983 88(C15), p.10,903-10,914, 60 refs.

The background atmospheric SO2 concentration above the sea surface has been established at 35 pptv. We have shown that one of the mechanisms of SO2 formation is the biogenic production of reduced organic sulfur compounds in the ocean. Dimethyl sulfide (DMS) has been observed in oceanic areas, with concentrations widely ranging in surface waters and in the marine atmosphere. This compound is emitted into the atmosphere and oxidized there by photochemically induced processes. That leads partly to SO2 formation, and subsequently, to sulfate. This hypothesis is corroborated by a correlation between atmospheric SO2 concentrations and the relation between atmospheric SO2 concentrations and biological activity. The flux of sulfur by this process and by sea spray is estimated as being from 71 to 116 million tons/yr. Sulfur data over and produced by the southern oceans was gathered from the vicinities of the several subantarctic islands and in some regions as far south as 62S. (Auth. mod.)

Mook, W.G., Koopmans, M., Carter, A.F., Keeling, C.D., **Seasonal, latitudinal, and secular variations in the abundance and isotopic ratios of atmospheric carbon dioxide. 1. Results from land stations,** *Journal of geophysical research,* Dec. 20, 1983 88(C15), p.10,915-10,933, 21 refs.

Between March 1977 and February 1982, 517 samples of air were collected in 51 glass flasks at four stations in the northern hemisphere near the Pacific Ocean and at the South Pole. First, the CO2 concentration of each sample was determined by nondispersive infrared gas analysis, and then the 13-C/12-C and 18-O/16-0 ratios of the cryogenic extracted CO2 were determined with a triple collector mass spectrometer. For each station the secular trend and seasonal variation in 13-C/12-C ratio have been established as a function of CO2 concentration. Details of the variations are given for each station. (Auth. mod.)

Löffler, E., **Macquarie Island, a wind-formed natural landscape in the Subantarctic** [Macquarie Island—eine vom Wind geprägte Naturlandschaft in der Sub-Antarktis], *Polarforschung,* 1983 53(1), p.59-74, In German with English summary. 37 refs.

The two dominant environmental factors on Macquarie Island are the constantly low temperatures and the high wind velocities. The low temperatures are the overall limiting factors for the vegetation as a whole while the exposure to wind determines the distribution of the vegetation types and of small scale geomorphological features. The hard cushion formation (feldmark) occupies most of the wind exposed plateau area. With decreasing wind exposure the hard cushions are replaced by herb fields, bogs or fens depending on the height of the ground water table. The coastal areas, which are generally less wind exposed, are covered by *Poa foliosa* grassland. While wind exposed slopes exhibit a high degree of slope mobility, the lee slopes are much more stable and are characterized by large stable terraces. Oblique terraces occur on slopes that have neither a clear leeward nor windward aspect and are transitional forms between the unterraced windward slopes and the terraced lee slopes. (Auth.)

Simmonds, I., Lin, Y.-B., **Topographic and thermal forcing in a general circulation model of the Southern Hemisphere—January case,** *Melbourne (Australia). University. Department of Meteorology. Publication,* Sep. 1983 No.24, 88p., Refs. p.83-88.

We have used a spectral general circulation model of the Southern Hemisphere to examine aspects of the role of topography and thermal forcing in determining January climate in that hemisphere. A control run of the model is compared with separate anomaly experiments in which all topography was removed, Antarctica only removed, and finally in which the sea surface temperature was set to its observed zonal average at each latitude. The topography anomaly experiments produced little gross changes to the surface pressure field. In particular, the location of the sub-tropical highs does not seem to be directly linked to the presence of the topography. The 'sub-Antarctic' trough is also present in all the runs. The sub-tropical highs tend to extend across all the ocean basins when zonal sea surface temperature variation is removed. At upper levels, the effects of topography anomalies are most noticeable at higher latitudes and the amplitude of the stationary waves there are reduced. Various analyses performed here cast light on these and other effects of forcing in the Southern Hemisphere. (Auth.)

Borzenkova, I.I., **Global temperature trend in the Cenozoic,** *Soviet meteorology and hydrology,* 1981 No.12, p.17-25, Translated from Meteorologiia i Gidrologiia. 30 refs.

The results of paleotemperature determinations made by oxygen-isotope analysis of the remains of marine planktonic and benthic microfauna are generalized, along with results of paleobotanic analyses of fossil flora from the Cenozoic (the last 60-65 m. y.). Analysis of these materials indicates a progressive lowering of temperature over the entire period at all latitudes in both hemispheres. Against the background of the general cooling trend, there have been two warming periods (the Eocene and Early Miocene maxima) that are observed at all latitudes. The Southern Hemisphere glacial cover formed about 15-11 m. y. a., while the Northern Hemisphere remained ice-free until the middle of the Pliocene (3-3.5 m. y. a.). Seasonal Arctic Basin ices may have existed throughout the entire Pliocene (4.5-5.0 m. y. a.), while the permanent ice cover formed no earlier than 0.8-0.9 m. y. a. (Auth.)

Grechko, E.I., Dianov-Klokov, V.I., **Spectroscopic measurements of the "additional absorbing mass" in total and partial cloudiness** [Spektroskopicheskie izmereniia "dopolnitel'noĭ pogloshchaiushcheĭ massy" v sploshnoĭ i razorvannoĭ oblachnosti], *Akademiia nauk SSSR. Izvestiia. Fizika atmosfery i okeana,* 1983 19(2), p.156-162, In Russian with English summary. 3 refs.

Shipboard measurements of "additional absorbing mass" (delta m) were made related to multiple scattering of photons in solid cloudiness in the Antarctic region. The averaged values imply an increase of absorbed solar radiation by a cloudy atmosphere up to 30-40% in comparison with the amount calculated without allowance for multiple scattering. Data for partial cloudiness in the equatorial region show a nonlinear dependence of delta m on the amount of cloudiness.

Andreas, E.L., Tucker, W.B., III, Ackley, S.F., **Atmospheric boundary-layer modification, drag coefficient, and surface heat flux in the antarctic marginal ice zone,** *Journal of geophysical research,* MP 1667, Jan. 20, 1984 89(C1), p.649-661, 71 refs.

During a traverse of the Antarctic marginal ice zone (MIZ) near the Greenwich Meridian in October 1981, we launched a series of radiosondes along a 150-km track starting at the ice edge. Since the the wind was from the north, off the ocean, these radiosonde profiles showed profound modification of the atmospheric boundary layer (ABL), as the increasing surface roughness decelerated the flow. The primary manifestation of this modification was a lifting of the inversion layer with increasing distance from the ice edge by the induced vertical velocity. But there was also a cooling of the stably stratified mixed layer below the inversion and a consequent flux of sensible heat to the surface that averaged over 200 W/sq m. The magnitude of this flux suggests that atmospheric heat transport plays a significant role in the destruction of ice in the Antarctic MIZ. Using the rising of the inversion and ABL similarity theory, we estimated the neutral stability drag coefficient across the MIZ increased from its open ocean value, .0012, at the ice edge to .004 at 80-90% ice concentration. We present an equation for this dependence of drag on ice concentration that should be useful for modeling the surface stress in marginal ice zones. (Auth.)

Saxena, V.K., **Evidence of the biogenic nuclei involvement in Antarctic coastal clouds,** *Journal of physical chemistry,* Oct. 13, 1983 87(21), p.4130-4134, 26 refs.

Antarctic coastal clouds that form as a result of advection of marine air over the Ross ice shelf during the austral summer were investigated during a field experiment conducted in October-November 1980. Observational data on the spatial and temporal distribution of cloud condensation nuclei (CCN) activity spectra, Aitken nuclei concentrations, and chemical characteristics of the cloud water that was collected through direct aircraft penetrations of clouds were obtained. The collected cloud water was examined by a Perkin-Elmer infrared spectrophotometer, electron microscope, and X-ray energy dispersive analysis. Part of the water sample was allowed to stand at room temperature under diffused light. These analyses demonstrated, first, the growth of an algae, suspected to be *Planktonema lauterbornii,* in the "clean" Antarctic cloud water, second, the presence of proteinaceous matter as indicated by the infrared absorption spectra, and third, an abundance of ionically bonded potassium chloride salt rather than sodium chloride. Kusunoki, K., ed, **Proceedings of the Fifth Symposium on Polar Meteorology and Glaciology,** *Tokyo. National Institute of Polar Research. Memoirs,* Nov. 1983 Special Issue No.29, 227p., For individual papers see 38-2001 through 38-2015 or F-29266, F-29271, F-29272, F-29274 through F-29277, I-29261 through I-29265, I-29267 through I-29270, I-29278 and J-29273.

The results of field research in 1981 are presented together with the analyses of data obtained in the previous years. This symposium also aimed at the presentation of preparatory work to contribute to the internationally coordinated Middle Atmosphere Programme (MAP);

the Japanese MAP in the Antarctic is to be implemented in 1982-1985. The main topics of the symposium are: clouds and snow crystals, synoptic meteorology, boundary layer meteorology, radiation, snow cover, ice sheet, climatic change, sea ice and oceanography, and middle atmosphere. Fifty-three papers were presented and the present volume contains 22 original papers and 26 abstracts. These papers are arranged in the order of scientific areas of meteorology, oceanography, glaciology, and MAP-related subjects. (Auth.)

Ishikawa, N., Kobayashi, S., **Climatological features of Mizuho Station in katabatic wind zone, East Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Nov. 1983 Special Issue No.29, Symposium on Polar Meteorology and Glaciology, 5th, 1982. Proceedings. Edited by K. Kusunoki, p.1-15, 18 refs.

Climatological features of Mizuho Station are described using seasonal variations in, and frequency distributions of meteorological elements for individual months as well as periodicities of individual variations and cross-correlations obtained by spectral analyses on the basis of data collected in 1980. The findings follow: Air pressure obtained at Mizuho Station decreases and has its minimum in winter. On the other hand, it maintains an almost constant value at Showa Station during the year; therefore, the pressure difference between Mizuho and Showa increases in winter. Air temperature shows a remarkable daily variation in summer. In winter this short-time periodic variation disappears and the the semi-long periodicity of about five days obtains. A strong wind blows almost constantly throughout the year, the annual mean being about 11 m/s. A significant cross-correlation is shown between air temperature at Mizuho and air pressure at Showa in winter. (Auth.)

Ohata, T., **Atmospheric conditions for extremely low air temperatures at Mizuho Station, Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Nov. 1983 Special Issue No.29, Symposium on Polar Meteorology and Glaciology, 5th, 1982. Proceedings. Edited by K. Kusunoki, p.16-23, 4 refs.

For the occurrence of extremely low air temperature at Mizuho Station, the following conditions are required. The wind direction at 600 mb which can be considered to be the geostrophic flow above the inversion layer, should be from south to west (S-W) at Showa Station. The wind direction at Mizuho Station is from SE-SW, meaning the synoptic scale pressure gradient from SW-NW to NE-SE which is in the opposite direction of the fall line there. The moisture content of the air mass should be low so that there is no cloud formation. Also the air temperature has to be at least lower than the monthly mean. If these conditions are satisfied, a quite strong temperature inversion will occur near the surface, resulting in extremely low surface air temperature. Wind speed at the surface level is only a little lower than the average. (Auth.)

I-29263

Inoue, J., Nishimura, H., Satow, K., **Climate of the interior of Mizuho Plateau,** *Tokyo. National Institute of Polar Research. Memoirs,* Nov. 1983 Special Issue No.29, Symposium on Polar Meteorology and Glaciology, 5th, 1982. Proceedings. Edited by K. Kusunoki, p.24-36, 14 refs.

The scheme and results of the mobile meteorological observation on Mizuho Plateau are reported. The surface wind and temperature at 4 temporary stations on the traverse route were compared with those of Mizuho Station during the same period. Each station is classified under the category of cold katabatic or cold interior climate though the transitional status is revealed for the latter. Evident decrease of surface wind inland is due to the decrease in the surface inclination. The increase in the temperature lapse rate inland resulting from the lowering of minimum temperatures is caused by the weakness of the surface wind when the minimum temperature is present as well as by the light inland breeze. It is also caused by the decrease of the effect of synoptic disturbances. The surface prevailing wind at V142 (upper end of the plateau) originates from further inland. The small inversion and the locally produced northerly wind was present when the general wind was blocked at V142. The cooling of the atmosphere over V142 begins either from the surface or from the height of lower troposphere. (Auth. mod.)

Kobayashi, S., Ishikawa, N., Ohata, T., Kawaguchi, S., **Observations of an atmospheric boundary layer at Mizuho Station using an acoustic sounder,** *Tokyo. National Institute of Polar Research. Memoirs,* Nov. 1983 Special Issue No.29, Symposium on Polar Meteorology and Glaciology, 5th, 1982. Proceedings. Edited by K. Kusunoki, p.37-49, 19 refs.

Acoustic sounding was used in observing a katabatic wind layer at the lowest few hundred meters over Mizuho Station. Some examples of acoustic echo return showed the structure of surface inversions in connection with a katabatic wind and the behavior of breaking waves, e.g., a "herringbone" type structure described as an unstable wave. Observations disclosed that wave-like motion exists in a layer between the heights of 100 and 300 m and it has a shorter period than the calculated value from the Brunt-Väisälä frequency. This discrepancy is explained by a simple two-dimensional wave equation, considering the presence of mean atmospheric flow. (Auth.)

Adachi, T., **Numerical simulation of strong katabatic winds at Showa and Mizuho Stations, Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Nov. 1983 Special Issue No.29, Symposium on Polar Meteorology and Glaciology, 5th, 1982. Proceedings. Edited by K. Kusunoki, p.50-60, 18 refs.

The vertical profiles of the wind speed and air temperature and the wind spiral are studied in the case of the typical strong katabatic wind observed by radiosondes at Showa and Mizuho Stations. The vertical profiles of the two horizontal wind components, eddy diffusivity, shear stress and local value of Monin-Obukhov length are calculated with the numerical model of the katabatic winds developed by the author in 1979. The numerical solutions of the katabatic wind profiles agree well with the observed ones at Showa Station. (Auth.)

I-29267

Kawaguchi, S., **Effective infrared emissivity of clouds in Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Nov. 1983 Special Issue No.29, Symposium on Polar Meteorology and Glaciology, 5th, 1982. Proceedings. Edited by K. Kusunoki, p.70-76, 14 refs.

Emissivity values of low and middle clouds deduced from 26 radiometersonde ascents carried out during 1967-1969 at Showa Station are presented. The effective emissivity was dominated more by the radiation field of the cloud circumference than by the radiative property of cloud itself. The emissivity increased with increasing cloud thickness up to 800-1000 m, and thereafter had a high constant value about 0.95 for the downward flux. The emissivity showed a decreasing tendency with increasing cloud base height. The IR radiative cooling of cloud is very notable; a cooling rate of 10 degrees C/day was found in the upper part of the clouds and zero cooling rate or heating was found in the lower part. (Auth. mod.)

I-29268

Matsubara, K., Ohata, T., Kawaguchi, S., **Turbidity over the Indian Ocean,** *Tokyo. National Institute of Polar Research. Memoirs,* Nov. 1983 Special Issue No.29, Symposium on Polar Meteorology and Glaciology, 5th, 1982. Proceedings. Edited by K. Kusunoki, p.77-84, 18 refs.

Atmospheric turbidity measurements were carried out over the Indian Ocean by a sunphotometer during the voyage from Tokyo to Showa Station, Nov.-Dec. 1979 and also from Showa Station to Port Luis, Feb.-Mar. 1981. Between 17 N and 67 S the highest value of aerosol optical thickness was observed in the east end of the Indian Ocean close to the northwest coast of Australia, and the lowest value was in the region south of 20 S in the Indian Ocean. Aerosol optical thickness in low turbidity conditions depends on the wind speed, whereas in high turbidity conditions the dependency is not clear. (Auth. mod.)

I-29269

Matsubara, K., Kawaguchi, S., **Spectral extinction measurement by sunphotometer at Showa Station, Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Nov. 1983 Special Issue No.29, Symposium on Polar Meteorology and Glaciology, 5th, 1982. Proceedings. Edited by K. Kusunoki, p.85-93, 22 refs.

Spectral measurement of direct solar radiation was made by sunphotometer at Showa Station, January 1980 through January 1981. Average aerosol optical thickness was 0.023 with a maximum in October, minimum in November. Monthly mean Ångström turbidity coefficient *beta* ranges from 0.0045 to 0.0207 and *alpha* from 1.27 to 2.15. This result is in good accordance with recent measurements of optical thickness in Antarctica made by other researchers. The most important finding is that turbidity at Showa Station was fairly constant throughout a year while spectral extinction exhibited marked seasonal variation. It was also found that the seasonal variation of spectral extinction is caused by the seasonal change of aerosols which results from seasonal differences in the origin of air masses. (Auth. mod.)

Wada, M., Takeda, T., **Characteristic features of clouds in Antarctica as observed at Showa Station,** *Tokyo. National Institute of Polar Research. Memoirs,* Nov. 1983 Special Issue No.29, Symposium on Polar Meteorology and Glaciology, 5th, 1982. Proceedings. Edited by K. Kusunoki, p.94-102, 16 refs.

The relationship between atmospheric conditions and cloud types in Antarctica was investigated on the basis of aerological data at Showa Station in 1979 and 1980. When a low pressure passed near Showa Station, type I clouds in which the vertical profile of temperature was nearly moist adiabatic were most popular. These clouds were formed in both January and July. Type II clouds which were found in an isothermal layer were frequently observed in July, but they hardly appeared in January. Clouds of this type are characteristic of the polar regions. One of the reasons why the number of cloudy days in July is more than that in January is the appearance of type II clouds in July. (Auth.)

Ito, T., Ikegami, M., Kanazawa, I., **Aitken nuclei sonde with constant expansion ratio irrespective of ambient pressure,** *Tokyo. National Institute of Polar Research. Memoirs,* Nov. 1983 Special Issue No.29, Symposium on Polar Meteorology and Glaciology, 5th, 1982. Proceedings. Edited by K. Kusunoki, p.185-190, 13 refs.

A new type of Aitken nuclei sonde is reported. The sonde consists of an expansion fog chamber, which is similar in principle to the Pollak counter or the Aitken counter, as a measuring device of Aitken nuclei concentration. The fog chamber is very compact and automatic and it is constructed to keep the expansion ratio constant irrespective of ambient pressure. The constant expansion ratio is an essential requirement for the measurement of Aitken nuclei concentration at different heights by a balloon or an airplane. The variation of measured values during 50 measurements of the same air sample is smaller than 3% of the mean. Two identical fog chambers in the present sonde give Aitken nuclei concentrations which agree within 50/cu cm for the concentration range covering between about 200 and about 2000/cu cm. A nuclei measuring signal is inserted into rawinsonde signal, which is transmitted to a ground station, every minute for 10 s. The total weight of a sonde is 9 kg, comprising a 5 kg fog chamber, a 3.5 kg battery and a 0.5 kg rawinsonde.

Raper, S.C.B., Wigley, T.M.L., Jones, P.D., Kelly, P.M., Mayes, P.R., Limbert, D.W.S., **Recent temperature changes in the Arctic and Antarctic,** *Nature,* Dec. 1, 1983 306(5942), p.458-459, 11 refs.

Monthly mean station surface air-temperature data have been objectively analysed to produce time series of temperature anomalies for the Northern Hemisphere (1881-1980), the Arctic (1881-1980), and the Antarctic (1957-82). A comparison of recent changes in these three regions is made here. Previously published series have been updated to 1982. Changes in Arctic temperatures since about 1966 and in Antarctic temperatures since 1960 show significant warming trends. For the period from 1975 to 1982 there is a high positive correlation between temperature variations in the Arctic and Antarctic. (Auth.)

Lutsenko, E.I., Priamikov, S.M., Sarukhanian, E.I., Smirnov, N.P., **Semi-annual oscillations of thermobaric fields in the northern and southern hemispheres** [Polugodovye kolebaniia termobaricheskikh poleĭ v severnom i iuzhnom polushariiakh], *Leningrad. Arkticheskiĭ i antarkticheskiĭ nauchno-issledovatel'skiĭ institut. Trudy,* 1983 Vol.371, p.6-18, In Russian. 16 refs.

Analysis of measurements of pressure and temperature at various levels shows that the closest link between semi-annual geopotential oscillations and semi-annual solar tide is found at 500 mb, decreasing toward the Earth's surface and the upper edges of the troposphere.

I-29295

Lutsenko, E.I., **Annual oscillations of thermobaric fields in the troposphere of the northern and southern hemispheres** [Godovye kolebaniia termobaricheskikh poleĭ v troposfere severnogo i iuzhnogo polushariĭ], *Leningrad. Arkticheskiĭ i antarkticheskiĭ nauchno-issledovatel'skiĭ institut. Trudy,* 1983 Vol.371, p.34-47, In Russian. 18 refs.

Maximal amplitudes of annual pressure waves at sea level are caused by seasonal pressure increases over certain regions of the globe. Allowing for significant physiographic variations and the seasonal changes of solar radiation in the northern and the southern hemispheres, the recorded synchronousness of annual pressure fluctuations is considered a manifestation of interaction of atmospheric processes between the two hemispheres.

Iwasaka, Y., **Laser radar system for measurement of the middle atmosphere at Syowa Station in Antarctica,** *Antarctic record,* Dec. 1983 No.80, p.1-13, In Japanese with English summary. 1 ref.

A multiwavelength laser radar system was installed in 1983 in cooperation with the International Middle Atmosphere Program (MAP). The laser radar can simultaneously shoot two kinds of laser pulses, the fundamental wave and the second harmonic wave, by means of a ruby laser with regulated repetition frequencies and receive scattered light by a telescope with a 50 cm lens. The measurement is by using a photon counter for each wave and an A-scope for the fundamental wave. A test observation was successfully made in Japan and it showed remarkable increases of the stratospheric aerosol due to the volcanic eruption of Mt. El Chichon. It was also inferred that the size distribution of the particles in the aerosol layer is inhomogeneous. (Auth.)

Zhdanov, L.A., **Atmospheric processes over western Antarctica** [Atmosfernye protsessy nad Zapadnoĭ Antarktikoĭ], *Antarktika; doklady komissii,* 1980 No.19, p.173-187, In Russian. 7 refs.

Typical regional elemental synoptic processes, from meteorological and satellite data of 1972-1973 at McMurdo Station, are described. An earlier published method used for similar studies in eastern Antarctica was also used in this investigation of the western portion of the continent. Orographic characteristics of the McMurdo Sound region are discussed, and the seasonal variations of atmospheric circulation—with graphic representation of cyclone and anticyclone formations, kinematic charts and photographs—are presented. Results are used for the development of a synoptic statistical method to anticipate dangerous weather conditions and for the compilation of short-range weather forecasts.

Desa, E., Nayak, M.R., Prabhu Desai, R.G., Selvam, A.P., **Antarctic winter—as recorded at *Dakshin Gangotri*,** Indian Expedition to Antarctica, 1st. Scientific report, New Delhi, Department of Ocean Development, 1983, p.30-40, 4 refs.

The data tape of the automatic weather recording station set up by the first expedition was recovered by the second expedition. The station performed well and the entire tape shows valuable and consistent recorded data. The temperature records show progressive cooling with the advance of the antarctic winter with a minimum recorded temperature of -29 deg C. The wind data is consistent with published results of long term experiments showing winds generally from the South and South East sectors. The maximum wind speed recorded in the 6 months of recording was 85 mph from a southerly direction. Some qualitative explanations are put forward for the observations and the paper concludes with a set of recommendations for future experiments. (Auth.)

Sen Gupta, R., Qasim, S.Z., **Measurement of aerosol particles along a section from 8 N latitude to Antarctica in the southwestern region of the Indian Ocean,** Indian Expedition to Antarctica, 1st. Scientific report, New Delhi, Department of Ocean Development, 1983, p.100-105, 12 refs.

Measurements of aerosol particles along a transect in the southwestern Indian Ocean showed a gradual decrease of the particles towards Antarctica. Peaks were recorded at places where the air coming from other continents seemed to influence the atmosphere. The observed peak in the zone of Antarctic Convergence may be due to the effect of the flow of surface air from Antarctica towards the equator. Katabatic wind is probably the cause of another peak observed near the antarctic continent. An inverse relation has been found between the wind speed and aerosol content which is presumably due to "scrubbing effect" and dispersion. (Auth.)

Mokhov, I.I., Petukhov, V.K., Rusin, I.N., **Sensitivity of mass transfer at the antarctic ice sheet surface to climatic changes** [Chuvstvitel'nost' massoobmena na poverkhnosti lednikovogo shchita Antarktidy k klimaticheskim izmeneniiam], *Meteorologiia i gidrologiia,* 1983 No.11, p.52-59, In Russian. 22 refs.

The sensitivity of mass transfer to climatic changes is calculated on the basis of a thermodynamic model of air masses and energy balance in the surface atmosphere. The relationship between mass transfer and atmospheric radiation and temperature is determined. Model calculations agree with the empirical data obtained in the course of the year. The rate of sensitivity of mass transfer to CO2 concentration changes in the atmosphere agrees with results of calculations based on climatic models of the general circulation.

Pinto Peixoto, J., Corte-Real, J.A.M., **Energetics of the general circulation of the atmosphere in the Southern Hemisphere during the IGY, Part II: the cycle of the energetics of the atmosphere in the Southern Hemisphere,** *Archives for meteorology, geophysics, and bioclimatology. Ser. A,* 1983 32(1-2), p.1-21, 25 refs.

Tentative box diagrams of the energy cycle are given for summer, winter and annual mean conditions, on the basis of an assumption concerning the dissipation of eddy kinetic energy. The general features of the energy cycle in southern hemisphere are similar to those observed in the northern hemisphere; the intensity of the general circulation is higher in winter. The rate of generation of eddy available potential energy, indirectly estimated, is higher in summer while the baroclinic process of transformation of zonal available potential energy into eddy available potential energy is more intense in winter. The antarctic continent seems to play an important role in the energetics of southern hemisphere; its contributions to the generation of zonal available potential energy and to the conversion of this form of energy into eddy available potential energy are noteworthy. (Auth. mod.)

Hall, K., **Reconstruction of the Quaternary ice cover on Marion Island,** Antarctic earth science; fourth international symposium. Edited by R.L. Oliver, P.R. James and J.B. Jago, Cambridge University Press, 1983, p.461-464, 20 refs.
DLC QE350.A57 1983

Evidence in favour of extensive glaciation on sub-Antarctic Marion Island is presented. Available data indicate three phases of glaciation, each comprising a sequence of stades and interstades. The island stratigraphy is shown and the major glacial deposits briefly described. From the available evidence, particularly the moraines, a number of former glaciers are reconstructed. Temperature fell between 3 and 6.4 C at the glacial maximum, with an equilibrium line altitude depression of 650 m and an accumulation area ratio of 0.6. The interglacials are marked by tectonism and volcanism as a response to isostatic readjustment. Temperatures were similar to present with extensive pedogenesis and plant colonisation. High glacier velocities are indicated to compensate for large ablation rates. Glaciation was initiated by precipitation falling as snow due to the northward shift of the Antarctic Convergence.

Voskresenskiĭ, A.I., **Climate monitoring in Antarctica** [Klimaticheskiĭ monitoring v Antarktide], 25 let Sovetskoĭ antarkticheskoĭ ekspeditsii. (25 years of Soviet antarctic expeditions). Edited by E.S. Korotkevich and L.I. Dubrovin, Leningrad, Gidrometeoizdat, 1983, p.38-47, In Russian. 13 refs.

Basic requirements for organizing climate monitoring in Antarctica are examined, and two favorable conditions are pointed out: the distance of Antarctica from the sources of atmospheric pollution and the presence of the vast body of water surrounding it and separating it from other continents. The most significant climatological factors, as well as the structural characteristics of the atmosphere influencing climate monitoring, are described. First results of observations of atmospheric aerosols, moisture exchange, radioactivity, precipitation, etc., are presented.

Royer, A., De Angelis, M., Petit, J.R., **Thirty-thousand-year record of physical and optical properties of microparticles from an East Antarctic ice core and implications for paleoclimate reconstruction models,** *Climatic change,* 1983 5(4), p.381-412, Refs. p.409-412.

Ice samples from the 905 m deep Dome C core (East Antarctica) were studied in terms of insoluble microparticle contents. Various techniques were used: right angle light scattering, nephelometer (multiangle light scattering), Coulter counter and microscope analyses, in order to make a thorough study of the physical and optical properties of microparticles and their variations over the last 30,000 years. Because of the possible effect of atmospheric turbidity on the earth-atmosphere radiation balance, optical parameters of climatic importance were estimated for insoluble microparticles. The detailed profile of total microparticle mass concentrations shows a drastic difference between high Last Glacial Maximum (LGM) and low Holocene concentrations. The optical scattering properties of 18,000 BP continental dust do not indicate a significant difference with respect to Holocene dust in terms of particle size distribution and complex refractive index. The possible warming of the atmosphere in these regions is estimated at 3 K per day and should therefore be taken into account in paleoclimate reconstruction models. (Auth. mod.)

Parish, T.R., **Study of topographically forced surface winds in Antarctica with special emphasis on the katabatic flow at Adélie Land,** Madison, University of Wisconsin, 1980, 141p., University Microfilms order No.80-25842, Ph.D. thesis. Refs. p.128-131.

The most sensational feature of the climate of Antarctica is the katabatic winds found along the steeply-sloping coastal region. Of interest are the exceptional wind conditions along Adélie Land discovered approximately 70 years ago by an Australian expedition. The strength of the surface wind in this area is unsurpassed anywhere on earth. An attempt is made at explaining the extreme Adélie Land winds. Because the Adélie Land katabatic winds are so persistent, topography is thought to play a major role. Diagnosis of the winds inland of coastal Adélie Land show a strong confluence channel of radiatively-cooled air from the continental interior directed towards the coast. Topography acts to concentrate negatively-buoyant air into a narrow channel; it makes possible the extreme persistence of the katabatic flow at Adélie Land since the supply of cold air is nearly inexhaustible. Numerical models emphasizing effects of this topographic channelling and attendant huge cold air supply clearly show the confluence zone is a region of strong winds. It is concluded that the topographically forced convergence of air in the interior creates the large supply of cold air necessary for the strength and persistence of the Adélie Land katabatic winds. Douglass, A.R., **Model of the antarctic sink for stratospheric water vapor,** Ames, Iowa State University, 1980, 133p., University Microfilms order No.81-06007, Ph.D. thesis. Refs. p.104-107.

A model, based on temperatures derived from satellite-measured radiances and temperatures measured by radiosonde, has been developed to determine the maximum quantity of water vapor removed from the antarctic stratosphere for the winter of 1973. An analytic representation of the wind field, based upon several sources of information including geostrophic winds calculated from the satellite-derived temperature fields, balloon measured winds and the behavior of radiance waves in the polar region, has also been developed. The model results were found to be insensitive to the wind field parameters. For 1973, the sink strength is determined to be only about 1% of the total stratospheric water vapor burden. Annual variations in the sink magnitude are estimated for 1974 and 1975. The variations are found to be significant when years are compared to each other (35%-100%), but small compared to the total stratospheric mass of water vapor. These results are considered in the context of the annual stratospheric water vapor budget. (Auth.)

Streten, N.A., **Circulation contrasts in the southern hemisphere winters of 1972 and 1973,** *Australian meteorological magazine,* Sep. 1983 31(3), p.161-170, 14 refs.

Characteristics of the broadscale southern hemisphere circulation are examined for the winters of 1972 and 1973 when markedly diverse patterns of rainfall occurred over the southern continents. The principal significant contrasts occur in the latitude of the subtropical high pressure belt in particular regions and the longitudes of its pressure maxima, in the strength of the mid-latitude westerlies primarily at Pacific longitudes and in the sign and pattern of change of the Southern Oscillation Index. Lesser though distinct variation is evident in the characteristics of the Antarctic trough and the gross pattern of cyclonic distribution. The limited available data indicate contrasting sea surface temperature anomalies in the Australian sector. Sea ice data show only small variability between the two seasons but with contrasting late season anomalies in the Ross and Weddell sectors. (Auth.)

I-29831

Streten, N.A., **High latitude climates of the Pacific—past, present and future,** *Australian meteorological magazine,* Sep. 1983 31(3), p.185-197, 57 refs.

A brief review is given of the available historical record of instrumental observations at high latitudes of the Pacific, and selected examples are presented of proxy information sources particularly those for the late Quaternary over and bordering the high latitude ocean. The principal observed features of the present climate are described in terms of mean pressure, transient synoptic systems, wind, temperature, cloudiness, precipitation and sea-ice. Observed trends in the chemical composition of the global atmosphere are noted, and the characteristics of modelled climates at high latitudes resulting from extrapolated carbon dioxide trends are described. The limitations not only to knowledge of the past and the causes of interannual variability in the present climate but also to our ability to confidently predict future climates are emphasised. McKenzie, R.L., Johnston, P.V., **Springtime stratosphere NO2 in Antarctica,** *Geophysical research letters,* Jan. 1984 11(1), p.73-75, 13 refs.

We present springtime measurements of column amounts of stratospheric nitrogen dioxide measured by ground based absorption spectroscopy from Scott Base. There is a rapid buildup from less than a quadrillion molecules/sq cm; at the end of August to about 15 quadrillion molecules/sq cm by mid October. The period covered is the transition time between winter night, and summer day; and in general the 'overnight' decay of NO2 is small. The decay is most significant at times when the duration of sunlight per day exceeds 12 hours. There are large day to day variations in column amounts which indicate that transport is a significant factor. (Auth.)

Grosval'd, M.G., Shishorina, Zh.G., **Eleventh INQUA symposium on paleoclimatology and glacial history of the Southern Hemisphere** [Symposium XI kongressa INKVA po paleoklimatu i istorii oledeneniia iuzhnogo polushariia], *Akademiia nauk SSSR. Institut geografii. Materialy gliatsiologicheskikh issledovanii. Khronika obsuzhdeniia,* Apr. 1983 Vol.47, p.44-47, In Russian.

At the 11th INQUA congress a special symposium was held on climatic and glaciation histories of the Southern Hemisphere. Seven papers presented formed two groups, depending on the evidence used: one had land surveying data, another was based on marine geology and stratigraphy, isotopic and micropaleontologic characteristics of deep bottom sediments of the southern ocean. Data from both groups, supplemented with materials on plate tectonics was used in the paper presented by Soviet scientists, titled *Development of the southern circumpolar current and glaciation of Antarctica.* Discussions included the history of Antarctic and Subantarctic islands, a critical review of glaciation of the islands surrounding the Scotia Sea. It is explained why the Falkland Islands underwent only the cirque type of glaciation, while islands to the south were entirely covered with ice caps, extending to their shelves. It was established, that the last glaciation of the islands was synchronous with that of the Antarctic shelf and North America's Wisconsin glaciation. Data discussed has shown, that at the present investigation level, the correlation of the glacial and climatic histories of the Southern Hemisphere can be only approximate and hypothetical.

Trenberth, K.E., **Interannual variability of the Southern Hemisphere circulation: representativeness of the year of the global weather experiment,** *Monthly weather review,* Jan. 1984 112(1), p.108-123., 37 refs.

Total variance fields of geopotential height, the north-south and east-west wind components and poleward transient eddy momentum fluxes at 500 mb are analyzed along with their contributions from two broad frequency bands covering 2-8 day and 8-64 day period fluctuations. Largest interannual variability occurs between 40-60 S in association with the main jet stream in summer or the polar jet stream in winter and the main belt of eddy activity within each season. The circulation and eddy statistics during the year of the Global Weather Experiment (GWE) are compared with the means and standard deviations over all years from 1972-80, and contrasted with individual years. The year of the GWE was characterized by an exceptionally deep circumpolar trough, an increase in westerlies between 45-70 S and a decrease to the north, with a southward shift in the main westerly jet during summer 1978-79 and a considerably enhanced and southward shifted polar jet but weaker subtropical jet in winter 1979. Associated with these changes was a southward shift in storm tracks and high frequency eddy activity throughout the year. (Auth. mod.)

Loon, H. van, Rogers, J.C., **Interannual variations in the half-yearly cycle of pressure gradients and zonal wind at sea level on the Southern Hemisphere,** *Tellus,* Jan. 1984 36A(1), p.76-86, 13 refs.

Half-yearly oscillations in sea-level pressure gradients and zonal winds on the Southern Hemisphere are outlined by means of daily synoptic maps for several years. The pressure oscillation has amplitude peaks near 50 S and the Antarctic coast, separated by a minimum along 60 S where the phase changes from maxima in the extreme seasons in the south to maxima in the transitional season in the north. The zonal geostrophic wind consequently has a half-yearly wave with equinoctial maxima in the latitudes near 60 S, and one with solstitial maxima north of 50 S. The interannual variability of the half-yearly oscillations in the pressure gradients and winds is described and examples are given of the oscillations during FGGE and the IGY. (Auth.)

Hartman, D.L., Mechoso, C.R., Yamazaki, K., **Observations of wave-mean flow interaction in the Southern Hemisphere,** *Journal of the atmospheric sciences,* Feb. 1, 1984 41(3), p.351-362, 28 refs.

Variations of zonal mean and eddy properties in the Southern Hemisphere during the winter of 1979 are studied. Several periods of enhanced wave activity and rapid zonal-mean changes are observed. During these periods of rapid change both the actual zonal wind tendency and the Eliassen-Palm flux divergence have a dipole pattern in the upper stratosphere, with positive values in high latitudes and negative values in middle and low latitudes. The positive values of E-P flux divergence near the pole suggest a possible source of wave activity in this region. The stationary component of wavenumber 1 and the eastward traveling component of wavenumber 2 contribute most to the dipole pattern of wave driving in the stratosphere. The lower wavenumbers contribute most to the driving in high latitudes, while the driving in lower latitudes is contributed mostly by high wavenumbers. Wave forcing of the mean flow as measured by the

E-P flux divergence and actual changes in the mean flow are correlated with each other, but the actual mean flow tendencies are often significantly smaller than the eddy driving. The largest correlations between E-P flux divergence and the observed zonal mean wind changes exceed 0.5 and occur both in the upper stratosphere near the jet core and near the tropopause across a broad range of latitudes. Tolstikov, E.I., **Meteorological research in the Arctic and Antarctic during the Soviet years,** *Soviet meteorology and hydrology,* Nov. 1977 No.11, p.69-72, For Russian original see 32-2192, or 10I-19587.

This is an historical review of the meteorological research programs carried out by the Soviet Union since the Revolution. Included in the overview are international programs, such as POLEX, in which they have participated. Fundamental results are summarized, especially for recently completed work, and a brief outline of plans for the future is presented.

Sansom, J., **Temperature record of Scott Base, Antarctica,** *New Zealand journal of science,* 1984 27(1), p.21-31, 8 refs.

The temperature record of Scott Base for the period 1958-1982 is shown as time series in which no significant overall warming or cooling trend appears. The distribution of the temperatures fits a bimodal model with nearly equal-sized normal modes at about 1 C either side of the overall mean. The average time that the temperature fluctuates about a particular mode is approximately 2 years, and the frequency of change of mode follows Poisson's distribution with changes taking place within a month or two. This bimodal behavior appears to be fairly local to Scott Base and can be used to explain an apparent warming trend. (Auth.)

Koshel'kov, IU.P., Butko, A.I., **Seasonal variations in atmospheric temperature in the Southern hemisphere at heights of 25-80 km,** *Soviet meteorology and hydrology,* 1980 No.4, p.6-9, 23 refs. For Russian original see 11I-23457.

From mean monthly southern hemisphere temperature readings at 25-80 km heights and from the equator to Molodezhnaya Station, amplitudes and phases of annual and semiannual oscillations are calculated. The comparison is made with northern hemisphere data, and large interhemispheric differences are found in the nature of seasonal variations. These differences confirm the necessity for creating reference atmospheric models for each hemisphere separately. (Auth.)

Jouzel, J., Merlivat, L., Lorius, C., Pourchet, M., **30000 yr. climatic record. Main results deduced from oxygen 18 and deuterium profiles from the Dome C ice core (Antarctica),** Symposium on variations in the global water budget, Oxford, U.K., Aug. 10, 1981. Conference proceedings, [1981], 1p. DE82 702351, CEA-CONF-5877.

A continuous oxygen 18 profile measured along a 906 m ice core drilled at Dome C in East Antarctica yielded an isotopic climatic record spanning about the last 30,000 years. The lower d value observed for the last and coldest part of the ice age reflects a higher relative humidity in the oceanic area providing the moisture for antarctic precipitation.

Keeling, C.D., **Atmospheric and oceanographic measurement needed for establishment of data base,** Potential effects of carbon dioxide-induced climatic changes in Alaska; The proceedings of a conference. Edited by J.H. McBeath, Fairbanks, University of Alaska, Mar. 1984, p.11-22, 13 refs.

Measurements of atmospheric CO2 going back to the 1950s are reviewed and man's part in the increase, especially in the Northern Hemsiphere, through the burning of fossil fuels is discussed. A need is seen for additional measuring stations to supplement (or in some cases to replace) those at South Pole, Baring Head, N.Z., Mauna Loa, La Jolla, Calif., Weathership P, and Barrow. Diagrams show the patterns of atmospheric CO2 increases from these stations plus Christmas and Fanning Islands, Cape Kumukahi, and the 1980 FGGE stations.

Weller, G., **Sea ice, carbon dioxide, and climate,** Potential effects of carbon dioxide-induced climatic changes in Alaska; The proceedings of a conference. Edited by J.H. McBeath, Fairbanks, University of Alaska, Mar. 1984, p.199-208, 44 refs.

Numerical modeling experiments have indicated that atmospheric warming due to an increased carbon dioxide content of the atmosphere will be highest in the polar regions. Sea ice, which responds to temperature variations by advancing or retreating, may therefore be a sensitive indicator of such a climatic change. The present paper examines the physical properties and processes of Antarctic sea ice and their probable relation to climatic change. These processes are complicated by various feedback mechanisms, and the carbon dioxide effects are difficult to quantify against a noisy background of climate-related processes and variations. The sea-ice zone of the Antarctic is also an important global sink for carbon dioxide, due to the intensive vertical exchange processes which occur there. It is suggested that monitoring of sea-ice extent may provide an early sign of carbon dioxide-induced climate change. (Auth.)

Yamanouchi, T., Iwashina, I., Seo, Y., **Derivation of total ozone amount in the antarctic atmosphere from TOVS of TIROS-N/NOAA satellites,** *Antarctic record,* March 1984 No.81, p.9-15, In English with Japanese summary. 11 refs.

A simple regression method is applied to derive the total ozone amount from the TOVS data of TIROS-N/NOAA meteorological satellites received at Showa Station, Antarctica. Besides channel 9 located in the ozone 9.6 micron band, channels 1, 2, 3 and 8 of HIRS/2 are used. Regression coefficients are determined against Dobson measurements at Showa Station. Data from 50 orbits of NOAA-6 and -7 are analyzed for 1981-1982. RMS errors of retrieved ozone amounts are 3 to 13 DU at Showa Station. Horizontal distributions of the total ozone amount are also given and fairly good agreements are seen at the South Pole between the ozone amounts derived from satellites and ground Dobson measurements. (Auth.)

Ueno, T., Matsubara, K., Sakamoto, T., Matsuhara, K., **Meteorological observations at Syowa Station in 1980 by the 21st Japanese Antarctic Research Expedition,** *Antarctic record,* March 1984 No.81, p.16-37, In Japanese with English summary. 8 refs.

This paper describes the results of meteorological observations (mainly surface and aerological) at Showa Station from February 1, 1980 to January 31, 1981. The new processing system for the weather data (AMOS: Automated Meteorological Observation System) was set up in January 1980, and automated upper-air observations by means of this system began in February 1980. Remarkable characteristics are as follows: 1) The temperature remained high through the year. The mean temperature of 1980 was 2.2 C higher than the normal, which was the highest value since our observation had started. 2) Sea ice around Ongul Islands flowed away due to the heavy blizzard which hit on March 17-18, 1980. This phenomenon was the first experience since Showa Station had been established. (Auth.)

Burns, G., **Variation of Southern Hemisphere atmospheric vorticity around interplanetary magnetic field sector crossings,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Dec. 1983 No.14, 27p., 16 refs.

The variation of a Southern Hemisphere absolute vorticity area index about solar sector boundary crossings is examined by the superposed epoch method. It is concluded that the Southern Hemisphere results do not confirm the winter decrease in vorticity near sector crossings found by researchers using Northern Hemisphere data. There is, however, limited indication that the following Southern Hemisphere effects may exist: (a) A vorticity decrease in the summer months showing a shape similarity to the Northern Hemisphere winter response. (b) A winter peak in vorticity on the boundary crossing date for the Australian quadrant of the Southern Hemisphere. (Auth.)

Ito, T., **Study on properties and origins of aerosol particles in the antarctic atmosphere,** *Papers in meteorology and geophysics,* Sept. 1983 34(3), p.151-219, In Japanese with English summary. Refs. p.216-219.

Seasonal variations of concentration, size and distribution of aerosol particles were studied at Showa Station with the following conclusions: particles smaller than 0.01 micron in radius are secondary particles which are produced through photochemical processes within the antarctic troposhere and which determine the properties of antarctic aerosols; in the consideration of the mechanism of global air pollution by aerosols more attention must be paid to the transport of relatively inert precursor gases and the subsequent generation of secondary particles than to a mere wide diffusion of polluting particles.

Barry, R.G., ed, **Workshop on antarctic climate data,** *Glaciological data,* Apr. 1984 No.15, 69p., Refs. p.24-28.

Deliberations of workshop participants examining the current status and suggested improvements of climatic data reporting are summarized. The areas covered are synoptic meteorology, climatology (standard and non-standard expedition-type reports), oceanography, glaciology, and satellite remote sensing. Tables listing existing data transfer and archival mechanisms are appended.

I-30185

Schwerdtfeger, W., **Weather and climate of the Antarctic,** Developments in Atmospheric Science, 15, Amsterdam, Elsevier, 1984, 261p., Refs. p.242-257.

This book presents an up to date description and explanation of the meteorological characteristics of Antarctica, including their close relation to the ice conditions on the surrounding water. Individual chapters cover radiation and surface temperature, the winds atmospheric circulation and its disturbances, and water as gas, liquid and solid. Climatological problems that need further field work and theoretical investigation are outlined in detail. Five appendices with tables listing antarctic weather stations and showing meteorological data gathered over the years, are included, as is an extensive bibliography.

Hansen, J.E., ed, Takahashi, T., ed, **Climate processes and climate sensitivity,** *American Geophysical Union. Geophysical monograph,* 1984 No.29, Maurice Ewing series, Vol.5. Maurice Ewing Symposium, 4th, Palisades, NY, 1982, 368p., Refs. passim. For selected papers see 38-4246 through 38-4255 or I-30281 through I-30287.

This monograph discusses climatic processes and climatic sensitivity using observational data in the northern and southern hemispheres. The book is organized into conventional areas, such as the atmosphere, ocean and cryosphere, which are bound together by the feedback processes.

I-30281

Bentley, C.R., **Some aspects of the cryosphere and its role in climatic change,** *American Geophysical Union. Geophysical monograph,* 1984 No.29, p.207-220, Refs. p.218-220.

The ice cover of the earth plays a direct and important role in climate and climatic change. Sea ice responds rapidly and sensitively, and is important because of effects on albedo, heat exchange between ocean and atmosphere, and oceanic mixing. Glaciers (including ice sheets) interact on a longer time scale, but some mechanisms for significant changes on a human time scale do exist. The possibility of rapid disappearance of the West Antarctic ice sheet with a consequent 5-m rise in sea level has received much attention. There is some evidence that the extent of the Antarctic sea ice cover had diminished in the last few decades. Evidence related to the ice sheets is ambiguous—the measured rise in sea level suggests slow melting of the ice sheets, but field glaciological measurements, incomplete though they are, indicate just the opposite. Whatever the effect of climatic warming on the marine West Antarctic ice sheet, it appears to be physically impossible for it to go afloat in as little as 200 years; a more reasonable estimate of the minimum time needed is 500 years. (Auth.)

Barry, R.G., Henderson-Sellers, A., Shine, K.P., **Climate sensitivity and the marginal cryosphere,** *American Geophysical Union. Geophysical monograph,* 1984 No.29, p.221-237, Refs. p.235-237.

There is a significant dearth of information on high-latitude cloudiness and the surface properties of the seasonal cryosphere, and on the degree of association between them. Following a survey of available data, some new observational material is presented on cloud conditions in the vicinity of snow cover and sea ice margins, using both 3-D Nephanalysis data and DMSP imagery. 1-D radiative calculations are used to illustrate the urgent need for improved observational data on cloud cover and surface albedo. The presence of cloud cover strongly damps the net effect on planetary albedo of any perturbation in snow/ice extent; an effect which is neglected in simple treatments of the ice-albedo feedback mechanism. The general problem of the appropriate parameterization of high-latitude surface albedo and cloud regimes in GCMs is discussed in the context of the review of observational data. Results from the new GISS GCM illustrate some important problems to be overcome in all climate models. (Auth.)

Hibler, W.D., III, **Role of sea ice dynamics in modeling CO2 increases,** *American Geophysical Union. Geophysical monograph,* MP 1749, 1984 No.29, p.238-253, 21 refs.

Sensitivity simulations of a hierarchy of Antarctic sea ice models to atmospheric warming are carried out and analyzed. The study includes models with only a thermodynamic ice cover, models with *in-situ* leads but no ice transport, and a fully coupled dynamic/thermodynamic model that includes transport, leads and strength-thickness coupling. All models employ a 60-m-thick oceanic mixed layer, together with a spatially and temporally varying heat flux into the mixed layer from the deep ocean. The heat flux was generated interactively by using a fixed fraction of the ice growth and cooling rates from the full dynamic/thermodynamic model. The same spatially and temporally varying heat flux fields were used in all sensitivity simulations. Models including full ice dynamics effects are found to be less sensitive to atmospheric warming than thermodynamics-only models, while models with specified lead fractions are more sensitive than thermodynamics-only models. (Auth. mod.)

Parkinson, C.L., Bindschadler, R.A., **Response of Antarctic sea ice to uniform atmospheric temperature increases,** *American Geophysical Union. Geophysical monograph,* 1984 No.29, p.254-264, 31 refs.

The effect on Antarctic sea ice of hypothetical atmospheric temperature increases is simulated using a thermodynamic/dynamic sea-ice model. The results show noticeable regional differences in the response of the ice cover, with a hemispherically-averaged winter ice-edge retreat rate of 1.4 degrees of latitude for each 1 K increase in atmospheric temperatures. These retreat rates are non-linear with respect to temperature change, the sensitivity of the position of the ice edge decreasing as temperatures are further increased. This nonlinearity in the response of the ice edge occurs in the response of other ice variables as well, including the total ice area and total ice volume at maximum ice extent. By comparison, for the peak summer period, a 3 K temperature increase suffices to eliminate all ice except in the Amundsen and western Weddell Seas. (Auth. mod.)

I-30285

Thomas, R.H., **Ice sheet margins and ice shelves,** *American Geophysical Union. Geophysical monograph,* 1984 No.29, p.265-274, 29 refs.

A possible consequence of climatic warming is an increase in ice sheet melting rates and, ultimately, a perceptible rise in sea level. This would occur very slowly unless thinning at the ice sheet margins triggered a major increase in ice drainage rates. The ice sheet in West Antarctica is the one most susceptible to this type of collapse because it rests on bedrock well below sea level. The most probable outlet for rapid ice discharge would be through the area covered today by the Ross Ice Shelf, which would have to be severely weakened first. The most vulnerable portion of the ice sheet is probably that drained by Pine Island and Thwaites glaciers in West Antarctica. These glaciers are not protected by large ice shelves and, although there is no evidence for present day retreat, they may be the first glaciers to respond to climatic warming. However, even an order of magnitude increase in the activity of one of these glaciers would cause a sea level increase of less than 1 mm/yr. (Auth. mod.)

Fastook, J.L., **West Antarctica, the sea-level controlled marine instability: past and future,** *American Geophysical Union. Geophysical monograph,* 1984 No.29, p.275-287, 21 refs.

A world-wide coupled hydrosphere model, triggered by ablation-controlled terrestrial retreat along the landward margin of the northern hemisphere ice sheets, and amplified by the sea-level controlled marine instability, produces a sea-level curve which compares well with an oxygen isotope sea-level curve. Collapse of Antarctica from its maximum extent 18,000 years ago to a configuration similar to its present state is modelled. Implications for further retreat of West Antarctica following the removal of buttressing ice shelf in the Amundsen Sea are also shown. Modelling results suggest that the Amundsen Sea sector including Pine Island Bay can only be stabilized at its present position in the presence of a buttressing ice shelf. (Auth. mod.)

Mercer, J.H., **Simultaneous climatic change in both hemispheres and similar bipolar interglacial warming: evidence and implications,** *American Geophysical Union. Geophysical monograph,* 1984 No.29, p.307-313, Refs. p.311-313.

Simultaneity in the Northern and Southern hemispheres of the last interglacial 125,000 BP, and last glacial maxima 20,000 and 14,-500 BP, and the following abrupt and rapid warming 14-11,000 BP, so far defies satisfactory explanation. Ability to forecast the relative magnitude of future CO2-induced climatic warming in the Northern and Southern hemispheres is needed in order to foretell the response of the cryosphere; climatic models give contrasting prognostications. Inconclusive evidence for deglaciation of West Antarctica during the last interglacial suggests that the Antarctic area then warmed by as much as did the Arctic. In many ways the last interglacial was probably an analogue of a future CO2-induced warm interval; proof or disproof of the suspected exceptional level of last interglacial warmth in Antarctica is needed in order to estimate the sensitivity of the global climate system to CO2 input. (Auth.)

McCormick, M.P., **SAM II measurements of the polar stratospheric aerosol Volume I, Oct. 1978-April 1979,** *U.S. National Aeronautics and Space Administration. Reference publication,* Dec. 1981 NASA RP-1081, 71p., N82-13592, 6 refs.

DLC QC882.M43 1981 Vol.1

The Stratospheric Aerosol Measurement (SAM) II sensor aboard Nimbus 7 spacecraft providing extinction measurements of the Antarctic and Arctic stratospheric aerosol has a vertical resolution of 1 km. This report presents representative examples and weekly averages of these aerosol data as well as corresponding temperature profiles for the time and place of each SAM II measurement during the first 6 months of satellite flight. From the aerosol extinction-profile data, contours of aerosol extinction as a function of altitude and longitude or time are plotted. Also, aerosol optical depths are calculated for each week. Seasonal variations and variations in space for both polar regions are easily seen. Typical values of aerosol extinction at the SAM II wavelength of 1.0 micron for this time period are .001 to .003/km in the main stratospheric aerosol layer. Optical depths for the stratosphere are about 0.002. Polar stratospheric clouds at altitudes of about 22 km were observed during the Arctic winter at various times and locations. (Auth. mod.)

Parish, T.R., **Numerical study of strong katabatic winds over Antarctica,** *Monthly weather review,* Mar. 1984 112(3), p.545-554, 22 refs.

Certain coastal sections of Antarctica, most notably Adelie Land and Terra Nova Bay, experience anomalously intense, persistent katabatic winds. The forcing of such katabatic outflow is believed to originate several hundred kilometers upslope in the interior of the continent where cold air drainage currents from a large area converge into a relatively narrow zone focused on the steeply-sloping ice terrain near the coastline. Numerical simulations with a three-dimensional hydrostatic model incorporating terrain features representative of Adelie Land reveal a significant topographic channeling of the surface airflow. Katabatic wind speeds as depicted by the model are greatly enhanced downslope of the convergence channel. These results emphasize the importance of topography in the continental interior in shaping the character of coastal katabatic flow. (Auth.)

McPeters, R.D., Heath, D.F., Bhartia, P.K., **Average ozone profiles for 1979 from the NIMBUS 7 SBUV instrument,** *Journal of geophysical research,* June 30, 1984 89(D4), p.5199-5214, 10 refs.

Monthly average ozone profiles from the first year of operation of the solar backscattered ultraviolet (SBUV) instrument on the NIMBUS 7 satellite (November 1978 through October 1979) are tabulated for 10 deg latitude bands from 80 S to 80 N. For each month and latitude zone we list layer ozone amounts and standard deviations for 12 Umkehr layers (approximately 0-60 km) and the average total ozone for each zone. The ozone mixing ratio and number density at the center of each layer are also given. The average SBUV profiles agree with average Umkehr profiles measured at Boulder to within 10% over most of the range. The Krueger-Minizner model is a good representative ozone model for 45 N, agreeing with an annual average of our measured profiles to better than 10% between 20 and 60 km. (Auth.)

Lambert, G., Ardouin, B., Mesbah-Bendezu, A., **Atmosphere to snow transfers in Antarctica,** International Conference on Precipitation Scavenging, Dry Deposition, and Resuspension, 4th, Santa Monica, 1982, Vol.2, New York, Elsevier, 1983, p.1289-1300, Includes discussion. 18 refs.

An attempt is made to determine the washout factor of radioactive aerosols by antarctic snow over one or several years. The study is limited to SR-90 and PB-210, distinguishing as far as possible, wet and dry fallout. Cores were taken at several antarctic locations, packed, and shipped to a laboratory for processing. Measurements were also made of both nuclides present in the antarctic atmosphere and at various other locations throughout the Southern Hemisphere. Analytical methods are described and results are discussed.

Yamanouchi, T., **Variations of incident solar flux and snow albedo on the solar zenith angle and cloud cover, at Mizuho Station, Antarctica,** *Meteorological Society of Japan. Journal,* Dec. 1983 61(6), p.879-893, In English with Japanese summary. 43 refs.

The global radiation at Mizuho Station was large compared to that at a normal mid-latitude station. The atmospheric transmittance was high, averaging about 0.75 to 0.80 in summer because of the small amount of atmospheric molecules, aerosols, and water vapor. Diffuse radiation from a clear sky was about twice as large as that for the place of 0% albedo owing to the high surface albedo through the multiple reflection between the snow surface and atmospheric layer. The effect of clouds on reduction of global radiation was small also on account of the multiple reflection, especially in the visible spectral region. The effect of drifting snow was also examined. The cloudy sky albedo was higher than the clear sky albedo because of the variation of spectral distribution of the incident solar flux. The solar zenith angle dependence of the albedo varied as the micro and macroscale snow surface conditions; however, generally the albedo increased as the solar elevation decreased. Measured albedo was compared to the theoretical albedo calculated from a radiative transfer model, and good agreement was found on the average. (Auth. Mod.)

Bromwich, D.H., Kurtz, D.D., **Katabatic wind forcing of the Terra Nova Bay polynya,** *Journal of geophysical research,* May 20, 1984 89(C3), p.3561-3572, Refs. p.3570-3572.

It is proposed that the Terra Nova Bay polynya is formed and maintained through the combined influence of persistent katabatic winds, which advect bay ice eastward and prevent it from consolidating in the polynya, and the blocking action of the Drygalski Ice Tongue, which prohibits northward drifting pack ice from entering the bay. A review of available studies shows a confluence of surface air on the plateau west of Terra Nova Bay; descent of this air to sea level, as katabatic winds which drain principally through the Reeves Glacier valley; stability of katabatic outflow seaward of the coastal slope break, for distances comparable to observed polynya width; that bay waters maintain a high sea surface heat flux and that wind-generated wave and current activity prevents sea ice from consolidating; blocking action of the Drygalski Ice Tongue; and that the above recur each year.

Frederiksen, J.S., **Onset of blocking and cyclogenesis in Southern Hemisphere synoptic flows: linear theory,** *Journal of the atmospheric sciences,* Apr. 1, 1984 41(7), p.1116-1131, 32 refs.

A study is made of the instability properties of two instantaneous Southern Hemisphere synoptic flow fields. The growth rates, phase frequencies, perturbation streamfunctions and, for some modes, eddy heat and momentum fluxes of growing disturbances are obtained using a linear, spherical, five-level, quasi-geostrophic model. Both the zonally averaged and three-dimensional flow fields are studied and the eigenmodes are compared with the observed regions of the onset of blocking and of developing midlatitude cyclones. The two principal latitude bands of development are picked out by the instability solutions for the zonally averaged basic flows. For the three-dimensional basic states, the linear solutions reproduce the geographical locations of some of the principal regions of the onset of blocking and cyclogenesis reasonably well. Antarctic data are used in the analyses and modelling processes. (Auth.)

Garcia, R.R., Solomon, S., Roble, R.G., Rusch, D., **Numerical response of the middle atmosphere to the 11-year solar cycle,** *Planetary and space science,* April 1984 32(4), p.411-423, Refs. p.422-423.

A two-dimensional numerical model with coupled photochemistry and dynamics has been used to investigate the response of the middle atmosphere (16-116 km) to changes in solar activity over the 11-year solar cycle. Model inputs that vary with solar cycle include solar radiation, cosmic ray and auroral ionization rates and the flux of NOx at the model's upper boundary. In this study, the results of model runs for solar cycle minimum and maximum conditions are compared. Very large abundances of NOx are produced above 90 km by auroral particle precipitation. Considerable amounts of NOx are transported subsequently to the stratosphere by the global mean meridional circulation. It is shown that this excess NOx can lead to significant decreases in ozone concentrations at high latitudes and that it may explain observations of nitrate deposition in Antarctic snow. (Auth.)

Baker-Blocker, A., DeLuisi, J.J., Dutton, E., **Received ultraviolet radiation at the South Pole,** *Solar energy,* 1984 32(5), p.659-662, 5 refs.

Received ultraviolet radiation (UV) is an important but small component of total global radiation. This study focuses on received UV at the Amundsen-Scott Station at 90 S during the austral summers of 1978-79, 1979-80 and 1980-81, with emphasis on clear-sky periods. Measurements of received UV were made with an Eppley UV pyranometer, while nonspectral global radiation was measured using an Eppley pyranometer with quartz filter. From this study, it appears that received UV at the South Pole during clear sky periods has a remarkably uniform annual cycle. The midsummer peak average hourly value observed is 2.10 mW/sq cm, for a peak possible 24-hour value of around 50 mW/sq cm. (Auth.)

Pearman, G.I., Beardsmore, D.J., **Atmospheric carbon dioxide measurements in the Australian region: ten years of aircraft data,** *Tellus,* Feb. 1984 36B(1), p.1-24, Refs. p.23-24.

Observations of the atmospheric carbon dioxide (CO2) concentration made during the period 1972 through 1981 are presented. The data are based on air samples collected from aircraft throughout the troposphere and lower stratosphere over the Australian-New Zealand region and as far south as Antarctica. A description is given of the degree of natural variability of CO2 concentration at all levels of the troposphere and lower stratosphere. The average rate of concentration increase in the mid troposphere over the period represented by the data is 1.3 ppmv/y, varying considerably with time. These variations agree with similar variations, also tabulated, observed at the South Pole. The mid-tropospheric data indicate a fossil fuel airborne fraction over the period January 1973 to January 1981 of 0.57. The annual variation of the CO2 concentration in the mid-troposphere is discussed. (Auth. mod.)

Warburton, J.A., **Chemistry of precipitation in relation to precipitation type,** *Science of the total environment,* April 1982 Vol.23, p.379-386, 9 refs.

Collections have been made of several types of wet deposition and of aerosols in various particle size ranges. The chemical composition of the precipitation changes significantly from one precipitation type to another. The forms of deposition appear to be important factors controlling the concentrations and ratios of the elements which have been measured. The aerosol samples show significant changes in chemical composition with particle size, consistent with other observers' results. It is hypothesized that these changes in aerosol chemistry and those of the wet deposition are related, and that this information, combined with the theoretically supported processes of nucleation, Brownian capture, phoretic processes and impaction, provide a better insight to the physical processes involved in the removal of chemical impurities from the atmosphere. Samples examined in this study were taken from the Ross Ice Shelf. (Auth.)

Kowski, P., **Investigation of deuterium concentration relations between atmospheric water vapor and precipitation in the Schirmacher Oasis, East Antarctica,** *Akademie der Wissenschaften der DDR. Zentralinstitut für Isotopen- und Strahlenforschung. ZFI-Mitteilungen,* May 1984 No.89, p.31-45, 3 refs.

At Novolazarevskaya samples of precipitation and air moisture were collected from 1978 to 1981. The *delta*D values of those samples were measured and the correlation with temperature is presented. A comparison of *delta*D values of precipitation and air moisture samples provides information both about processes of condensation and the origin of precipitation. The measured results suggest that precipitation collected at Novolazarevskaya Station did form from atmospheric moisture sampled here. The precipitation is assumed to be condensed in the region east of the Wohlthat Massif and transported to the Schirmacher Oasis. (Auth.)

Hermichen, W.-D., Kowski, P., Strauch, G., **Isotope-glaciological situation in the surroundings of the Schirmacher Oasis/Dronning Maud Land—a first overview,** *Akademie der Wissenschaften der DDR. Zentralinstitut für Isotopen- und Strahlenforschung. ZFI-Mitteilungen,* May 1984 No.89, p.87-102, 15 refs.

Isotope studies of shelf and inland ice in the surroundings of the Schirmacher Oasis show that both the basal zone of the ice shelf and a base layer of inland ice with a thickness of several tens of metres, represent relics of the thick Late Pleistocene ice cap of Dronning Maud Land. The thicker upper part of the inland ice sheet is, up to the foreland of the Wohlthat Massif, composed of post-Pleistocene local precipitation. The isotope-stratigraphic division of the Novolazarevskaya Ice Shelf shows an approximately 200 m thick layer between the Pleistocene base and younger local firn-ice formations which is formed by the recent outflow of the Wegener Inland Ice. Lorius, C., Raynaud, D., Petit, J.R., Jouzel, J., Merlivat, L., **Late-glacial maximum-Holocene atmospheric and ice-thickness changes from Antarctic ice-core studies,** *Annals of glaciology,* 1984 Vol.5, p.88-94, Refs. p.93-94.

A review of Byrd, Vostok and Dome C Antarctic ice-core records indicates significant changes in atmospheric characteristics between the late glacial maximum (LGM) and the Holocene. This data is relevant to general circulation model (GCM) boundary conditions and validation of output results. Reciprocally, GCM data could help to interpret ice-core results and to extend observed high-latitude changes to a larger scale. During the LGM, low troposphere temperatures were colder by about 5 to 7 C and surface temperatures by 8 to 10 C over the Antarctic ice sheet. There are indications that snow accumulation was slightly lower and isotopic data suggests higher relative humidity over the ocean. A large increase in continental dust (up to a factor of 20) and marine aerosols (up to a factor of 5) is observed on the high antarctic plateau, both explained by the increased intensity of the large-scale atmospheric circulation modulated by desert and sea-ice area extension. Ice-core results show large changes in atmospheric CO2 concentrations with LGM values around 200 ppmv and "pre-industrial" values of about 260 ppmv. Finally, determinations of total gas content suggest that central West and East Antarctica were not thicker during the LGM in contrast with higher surface elevations inferred from coastal-ice studies. Roble, R.G., Kasting, J.F., **Zonally averaged circulation, temperature, and compositional structure of the lower thermosphere and variations with geomagnetic activity,** *Journal of geophysical research,* Mar. 1, 1984 89(A3), p.1711-1724, 91 refs.

A zonally averaged chemical-dynamical model of the thermosphere is used to examine the effect of high-latitude particle and Joule heating on the neutral composition, temperature, and winds at solstice for solar minimum conditions. The meridional circulation forced by solar heating alone is a summer-to-winter flow, with a winter enhancement in atomic oxygen. The high-latitude heat sources drive mean circulation cells that reinforce the solar-drive circulation in the summer hemisphere and oppose this circulation in the winter hemisphere. The changes in wind and temperature caused by the high-latitude heat sources increase the relative concentration of N2 and O2 in the high-latitude upper thermosphere and decrease the O concentration in the high-latitude lower thermosphere. For prolonged moderate levels of geomagnetic activity the peak atomic oxygen density in the polar regions can decrease by factors of 2-3 from geomagnetic quiet conditions. (Auth.)

Gérard, J.C., Roble, R.G., Rusch, D.W., Stewart, A.I., **Global distribution of thermospheric odd nitrogen for solstice conditions during solar cycle minimum,** *Journal of geophysical research,* Mar. 1, 1984 89(A3), p.1725-1738, 87 refs.

A two-dimensional model of the minor neutral constituents N(D-2), N(S-4), and NO from 70 to 360 km is formulated and used to investigate the global distributions of these species for December solstice conditions during solar cycle minimum. Transport of the minor neutral constituents by both the meridional and vertical circulation and vertical molecular and eddy diffusion are considered in the model. The calculated distributions of the minor neutral constituents for solar ionization only and for solar plus auroral ionization are considered. The results show that the summer-to-winter pole meridional circulation transports both NO and N(S-4) across the solar terminator into the polar night region where there is a downward vertical transport toward the mesosphere. The temperature and compositional structure and the circulation changes caused by high-latitude heating and the particle-induced production of N(D-2) and N(S-4) all combine to bring the calculated NO structure into better agreement with observations. The choice of the eddy diffusion coefficient critically controls the downward flow of thermospheric nitric oxide into the mesosphere. (Auth. mod.)

Jacobowitz, H., Tighe, R.J., **Earth radiation budget derived from the NIMBUS 7 ERB experiment,** *Journal of geophysical research,* June 30, 1984 89(D4), p.4997-5010, 10 refs.

Results of the ERB experiment are presented in the form of time-latitude cross sections, hemispherically and globally averaged time plots, and annual global averages for the time period spanning November 1978 through October 1979. Comparisons are made between results derived from the fixed wide field-of-view (WFOV) radiometers and those derived from the scanning narrow field-of-view (NFOV) radiometers. While there is excellent agreement in regard to the spatial and temporal variations, the absolute magnitudes differ. The NFOV yields outgoing longwave fluxes and albedos that are about 4W/M2 and 2.5%, respectively, greater than those derived from the WFOV sensors. Also, limited simultaneous comparisons are made between ERB results and those from the AVHRR on the NOAA 7 operational satellite. Antarctic and/or Subantarctic data are included in the cross sections and time plots. (Auth. mod.)

Hogan, A., **Particle concentrations at the South Pole, on meteorological and climatological time scales; is the difference important,** *Geophysical research letters,* Sept. 1984 11(9), p.850-853, 32 refs.

Sulfur and dust layers in glacial ice cores have been associated with volcanic activity. Particles collected on the South Polar Plateau during January of 1983 show the maximum concentration of sulfur aerosol to arrive at the surface from the lower troposphere at the beginning of a storm, and the maximum dust concentration to arrive from the upper troposphere as the storm weakens. The sulfur and dust particles did not arrive simultaneously on the meteorological time scale, posing a question in regard to the proper interpretation of the climatic aerosol record and the glacio-climatic record. (Auth.)

Andreas, E.L., Tucker, W.B., Ackley, S.F., **Variation of the drag coefficient across the Antarctic marginal ice zone,** *U.S. Army Cold Regions Research and Engineering Laboratory. Special report,* MP 1784, Apr. 1984 No.84-07, MIZEX bulletin. 3. Modeling the marginal ice zone, p.63-71, ADA-145 351, 40 refs.

In Oct. 1981 the U.S.-USSR Weddell Polynya Expedition crossed the Antarctic marginal ice zone (MIZ) near the Greenwich Meridian on the *Michail Somov*. Five radiosondes, launched along a 150-km track starting at the ice edge, showed profound modification of the atmospheric boundary layer (ABL) as increasing surface roughness decelerated the flow. An equation is presented for the dependence of the drag coefficient on ice concentration that should be useful for modeling the surface stress in marginal ice zones. The sounding profiles and meteorological data provided a comprehensive look at how surface roughness and temperature changes in the MIZ can affect the ABL.

Hogan, A., **On the interaction of aerosol with meteorology,** *Journal de recherches atmosphériques,* Jan.-Mar. 1984 18(1), p.41-67, With French summary. Refs. p.64-67.

Aerosol concentration, size, charge, and light scattering properties were measured several times a day at the South Pole. Simultaneous particle collections were made two to four times a day. Meteorological observations, including slow rise soundings to determine the structure of the lower atmosphere accompanied these measurements and collections. A seven-day period, which included cloudiness associated with advection of marine air over the station at its beginning, following a period of subsidence, is analyzed. Aerosol concentration was inversely correlated with ozone partial pressure during this event. Marine aerosol components dominated the cloudy and precipitating early phases of the storm. A maximum of marine, terrestrial and sulfur aerosol components occurred at the end of the storm, concurrent with ice crystal precipitation and intermittent supercooled fog, during a period of vigorous mixing caused by cold advection aloft. This was followed by a decrease in tropospheric wind speeds. Strong subsidence and a maximum of terrestrial aerosol with a minimum in sulfur concentration occurred in conjunction with a maximum in surface ozone, 36 hours following the storm. A return to more typical aerosol and ozone concentrations coincided with the re-establishment of more normal atmospheric structure. (Auth.)

Mroz, E.J., Alei, M., **Tracking antarctic winds,** *Antarctic journal of the United States,* 1983 18(5), p.235-236, 9 refs.

Marked seasonal differences in the atmospheric chemistry observed at the South Pole reflect seasonal changes in the meridional flow of air in the high southern latitudes. An experiment designed to track the meridional flow is planned. Two tracers, 12CD4 and 13CD4, will be released in 1984. These tracers are capable of being detected thousands of kilometers from the point of release. Samples will be collected by aircraft and ground stations to detect the passage of the tracer plume.

Wendler, G., Kodama, Y., Poggi, A., **Katabatic wind in Adélie Land,** *Antarctic journal of the United States,* 1983 18(5), p.236-238, 12 refs.

A joint U.S.-French experiment was designed in Adélie Land, where strong downslope winds are observed nearly continuously. The United States concentrated their measurements on the upper slopes while the French made their measurements in the coastal areas and telemetered their data to the year-round manned station at Dumont d'Urville. In the summer season of 1982-83, a traverse with Expeditions Polaires Françaises was made to service the previously installed unmanned automatic weather stations (AWS), obtain measurements of the boundary layer, and establish one new station. The monthly mean meteorological elements measured at D10 and Dome Circe in 1982 are shown. Boundary measurements obtained vertical profiles of dry-bulb and wet-bulb temperatures, atmospheric pressure, wind speed, and direction. These are being used to understand better the physical structure of the katabatic wind layer. An example showing the results of two soundings at D57 is presented and discussed.

I-30699

Parish, T.R., **Numerical simulation of katabatic flow,** *Antarctic journal of the United States,* 1983 18(5), p.239-241, 4 refs.

Certain coastal sections, most notably Adélie Land (67 S, 142 E), experience anomalously intense, persistent katabatic winds. The forcing of such katabatic outflow is believed to originate several hundred kilometers upslope in the interior of the continent where cold air drainage currents from a large area converge into a relatively narrow zone focused on the Adélie Land coastline. Numerical simulations with a three-dimensional hydrostatic model incorporating terrain features representative of Adélie Land reveal a significant topographical channeling of the surface airflow. Katabatic wind speeds as depicted by the model are greatly enhanced downslope of the convergence channel. These results emphasize the importance of topography in the continental interior in shaping the character of coastal katabatic flow.

Saxena, V.K., Curtin, T.B., **Air-sea interactions over the Ross Sea in the surface boundary layer,** *Antarctic journal of the United States,* 1983 18(5), p.241-243, 7 refs.

Previous studies have demonstrated that organic particulates are present in the antarctic coastal clouds over the Ross Ice Shelf. During the period from Dec. 1982 to Jan. 1983, our investigations were extended to test hypotheses regarding the origin of these organic particulates. It is currently believed that organic particulates are produced by the wave action at the surface of the Ross Sea off the annual ice edge. The cloud water collection procedure and equipment used are described. Analysis of the collected cloud water, precipitation, sea water, and particulate samples is underway. Preliminary analysis of selected aerosol particles and cloud water residue show the presence of elements that are characteristic of organic material.

Sheppard, J.C., Hardy, R.J., Hopper, J.F., **Antarctic hydroxyl radical measurements,** *Antarctic journal of the United States,* 1983 18(5), p.243-244, 5 refs.

This research was directed toward determination of the hydroxyl radical concentration in the lower-tropospheric air at McMurdo and South Pole Stations, using the carbon-14 tracer method. The measurement technique is described. The important reaction conditions —ozone, water vapor, temperature, and ultraviolet intensity—were determined in parallel with each hydroxyl radical measurement. Tabular data summarize the measurements. The measurements suggest that the summertime, midday hydroxyl concentrations are certainly below 500,000 per cu cm, probably lower. Comparison of the McMurdo Station and South Pole Station data with previous measurements made in Pullman, Washington, and the Caribbean Island of Barbados shows that the hydroxyl radical concentration does appear to be highest in the tropics, lowest in the antarctic polar region, and intermediate in the midlatitudes.

Hogan, A.W., Murphey, B., Kebschull, K., Townsend, R., **Meteorological and aerosol experiments in Antarctica,** *Antarctic journal of the United States,* 1983 18(5), p.247-248, 1 refs.

Research programs conducted at South Pole and McMurdo Stations during the 1982-83 austral summer included the analysis of surface ozone and aerosol concentration data collected at the McMurdo cosmic ray laboratory during the previous winter, studies of the structure of near surface air over the south polar plateau using slow rising meteorological balloons, and examination of the transport of aerosol material to the polar surface from these layers. Analysis of the data collected continues. Unusually cloudy skies with a bright aureole about the sun and much hazy light scattering through the arc of 90 deg about the sun were observed at South Pole Station during Jan. 1983.

I-30704

Carroll, J.J., **Studies of atmospheric energy transfer processes at the South Pole,** *Antarctic journal of the United States,* 1983 18(5), p.248-249, 4 refs.

Continuing studies of the conditions and mechanisms that affect the transfer of radiant and thermal energy near the surface at the South Pole are reported. The major focus of the current work is to describe the statistical distribution of variations in the local meteorological conditions and to examine these in terms of the fluid dynamical response of the atmospheric boundary layer to large-scale as well as local forcing. A plot of the departure of air temperature from its seasonal average vs the departure of the wind speed from its average for the austral winter of 1975 is shown as an example of the type of behavior being examined.

Rasmussen, R.A., Khalil, M.A.K., **Rare trace gases at the South Pole,** *Antarctic journal of the United States,* 1983 18(5), p.250-252, 13 refs.

The authors' research has shown that rare man-made gases including CHClF2 (F-22) and C2Cl3F3 (F-113) have reached the south pole. At present little is known about their sources or atmospheric removal processes. It is likely that these gases are very long-lived, with lifetimes of several decades. At current rates of increase the doubling time of F-22 and F-113 is only about 6 years. Present concentrations are extremely low; however, in the future the cumulative effects of these and similar compounds may become significant on the global scale. Included in this paper are 5 years of systematic measurements of CHClF2, C2Cl3F3, SF6, CHCl3, and CH3I at the south pole and, for contrast, at mid northern latitudes 45 N, Oregon).

Robinson, E., Bamesberger, W.L., **Air chemistry monitoring at Palmer Station,** *Antarctic journal of the United States,* 1983 18(5), p.253-254.

Preliminary results of air chemistry studies at Palmer Station in 1982 are described. The instrumentation consists of: (1) an automated electron capture gas chromatographic halocarbon analyzer for the analysis of fluorocarbons CCl2F2(F-12) and CCl3F(F-11), methylchloroform (CH3CCl3), carbon tetrachloride (CCl4), and nitrous oxide (N2O); (2) an automatic flame ionization gas chromatograph for the analysis of carbon monoxide (CO), methane (CH4), and carbon dioxide (CO2); (3) an ozone (O3) photometer; (4) a condensation nuclei (cn) counter, and (5) a Hewlett-Packard 85 data system with strip chart backup. F-12 showed a steadily increasing atmospheric concentration. The N2O time trend was also upward but at a much slower rate. The time trend for N20 was relatively small, but statistically significant. The CH4 data were also significant. Ozone concentrations ranged between 10 and 30 parts per billion, and concentrations of Aitken nuclei were generally within the range of 200 to 1,000 CN per ml.

Carroll, J.J., **On the determinants of the near surface temperature regime on the South Polar Plateau,** *Journal of geophysical research,* June 20, 1984 81(7), p.4941-4952, 23 refs.

Most studies of the physical climatology of the Antarctic interior focus on the local surface energy budget. The results of these studies are reviewed leading to the often cited conclusion that atmospheric heat transport is required from lower latitudes to maintain the temperature against the large radiative losses by the snow-atmosphere system of the interior plateau. Micrometeorological data taken over a 3 year period at the South Pole are presented, illustrating the annual cycle of the surface energy budget. In addition, these data, coupled with local 500 mb data, are used to examine the role of vertical and horizontal transport mechanisms in determining the near-surface temperature variations. In addition to the radiation budget, downward mixing through the boundary layer and transient horizontal advection appear far more important than local divergence or convergence effects in determining the local temperature.

Völksch, G., Schrader, G., **Coniometric dust measurements in Antarctica** [Über konimetrische Staubmessungen in der Antarktis], *Geodätische und geophysikalische Veröffentlichungen, Reihe 1,* 1983 No.9, Symposium zur Antarktisforschung der DDR, Garwitz 1982, p.107-111, In German with English and Russian summaries.

Dust is taken as an indicator of environmental pollution in the Antarctic. The authors apply the coniometric method and show it in a critical manner. Experimental measurements are carried through in the antarctic outdoor and indoor air. The results are discussed and compared with corresponding mean values of several rural and urban areas. In every case the indoor dust load is greater than outdoor. The values of the coniometric dust measurements obtained at Molodezhnaya in 1975 are comparable with the results of other authors. (Auth.)

Rogers, J.C., **Spatial variability of antarctic temperature anomalies and their association with the Southern Hemisphere atmospheric circulation,** *Association of American Geographers. Annals,* Dec. 1983 73(4), p.502-518, Refs. p.517-518.

The spatial variability of seasonal mean temperature departures at 26 stations around Antarctica, southern South America, and nearby islands is shown using factor analysis. An opposition in temperature anomalies between mainland stations and those on or near the Antarctic Peninsula is a recurring pattern of spatial variability in all seasons but spring. Other factors indicate that temperature anomalies alternate in sign around the continent and especially near the peninsula. The association between the spatial patterns of temperature variability and features of the atmospheric circulation at middle and higher latitudes of the Southern Hemisphere is also examined. In each season the time series of one factor is significantly associated with temporal variations in the strength of the 500 mb westerlies, measured using height differences across six pairs of middle-latitude and Antarctic stations. In winter and summer the westerlies are linked to the mainland/Peninsula temperature opposition pattern such that when zonal flow is anomalously strong, mainland stations are anomalously cold. In autumn and spring, temperature variability is highly related to meridional flow strength over New zealand and in the lee of the Andes, and is associated with interannual longitudinal shifts in the positions of the climatological lows near the Antarctic coast. A deep Andes trough is associated with longer-than-usual ice duration at the South Orkneys. Historically, strong troughing and heavy sea-ice conditions in the South Atlantic occurred between 1920 and 1935. (Auth.)

Howarth, D.A., **Analysis of the variability of cyclones around Antarctica and their relationship to sea ice extent,** *Association of American Geographers. Annals,* Dec. 1983 73(4), p.519-537, Refs. p.536-537.

Results of an analysis of the distribution and movement of extratropical cyclones around Antarctica, for the period Sep. 1973 through May 1975, are presented. Variations in seasonal cyclone frequencies, their preferred longitudinal positions, and the spatial and temporal fluctuations in latitude and pressure are shown, and these indicate good agreement with the known features of Southern Hemisphere climatology. The greatest numbers of cyclones occur during spring and fall, and their most common locations are near coastal embayments. A semiannual oscillation is present in the frequencies, mean latitudes, and mean pressures of the cyclones, although to varying degrees. Longitudinal variations in the intensity of the oscillation are also evident. The belt of maximum cyclone activity exhibits a distinct half-yearly cycle from mean monthly pressures. Harmonic analysis of the spatial variation of this belt and the simultaneous position of the sea-ice margin derived from microwave imagery suggests that there is little correlation between sea ice and cyclone tracks on a hemispheric scale. Close relationships are apparent for short time periods or in specific regions but will require more intensive study before causal mechanisms can be suggested. The asymmetry of the continent, rather than the extent of sea ice, is probably the principal factor involved in determining the longitudinal variations in the positions and tracks of cyclones around Antarctica on a hemispheric scale. (Auth.)

Tsigel'nitskiĭ, I.I., **Structure of the atmospheric boundary layer over the southern ocean** [O strukture pogranichnogo sloia atmosfery nad IUzhnym okeanom], *Sovetskaia antarkticheskaia ekspeditsiia. Informatsionnyĭ biulleten',* 1984 No.105, p.16-22, In Russian. 10 refs.

Quantitative values of atmospheric boundary-layer thermodynamics, obtained in the area between latitudes 45 and 62 S, including Australian and Atlantic portions of the southern ocean, as well as the Drake Passage, are presented. Regional differences are pointed out, showing greater turbulence over the Australian sector than in the other two areas.

Budretskiĭ, A.B., **New absolute minimum of air temperature** [Novyĭ absoliutnyĭ minimum temperatury vozdukha], *Sovetskaia antarkticheskaia ekspeditsiia. Informatsionnyĭ biulleten',* 1984 No.105, p.82, In Russian.

A new absolute minimum of air temperature was registered at Vostok Station on July 21, 1983: -89.2 deg C, topping the August 1960 record of -88.3. After the minimum was reached, the wind direction changed from north to northwest, the wind speed increasing rapidly and the air temperature beginning to rise. According to theoretical calculations, air temperature in the area could fall below -90 deg, but this would require prolonged absence of heat advection.

Kurzeja, R.J., Haggard, K.V., Grose, W.L., **Numerical experiments with a general circulation model concerning the distribution of ozone in the stratosphere,** *Journal of the atmospheric sciences,* July 1, 1984 41(13), p.2029-2051, 68 refs.

Two experiments were performed with a nine-layer quasi-geostrophic spectral model to simulate the distribution of ozone below 60 km. Experiment I included thermal and orographic forcing of the planetary-scale waves while experiment II did not include this forcing. Both experiments used a linear parameterization of ozone photochemistry. The two experiments were qualitatively similar but a high latitude winter ozone buildup was seen only in Experiment I. This buildup resulted from a Brewer-Dodson circulation forced by large-amplitude planetary-scale waves in the winter lower stratosphere. The model results also showed that photochemistry is important down to lower altitudes (20 km) in the summer stratosphere than was previously realized. An important photochemical discrepancy was noted between 22 and 30 km at low latitudes, where the model photochemical equilibrium mixing ratios were 25-40% larger than those inferred for the real stratosphere. This discrepancy may be due to insufficient NO2 in the model and can be resolved by more accurate daytime NO2 measurements. Antarctic regions are included in the analyses for developing the model and are shown in many of the diagrams. (Auth.)

Dittrich, G., Helbig, A., **Geodetic and meteorological investigations of terrestrial refraction over the ice sheet of Enderby Land** [Geodätische und meteorologische Untersuchungen der terrestrischen Refraktion über dem Inlandeis des Enderby-Landes (Ostantarktis)], *Geodätische und geophysikalische Veröffentlichungen, Reihe III,* 1981 No.48, p.1-245, In German. Refs. p.242-245.

From Feb 1974 to Feb 1975 regular measurements were made of vertical temperature profiles, zenith angles, and other meteorological parameters on the ice sheet south of Molodezhnaya. The measurements were made at the three points of a triangle having leg lengths of 2.8, 4.8, and 5.7km using varying heights for instruments and targets. Since no model exists of the air temperature, density, and humidity along a line-of-sight for a given orography, an attempt was made to derive an empirical expression of the differences of refraction angles. This expression is based on the more readily measured parameters of wind velocity, air temperature, changes with height of air temperature, cloudiness, and sun elevation.

De Angelis, M., **Soluble and insoluble impurities along the 950 m deep Vostok ice core (Antarctica)—Climatic implications,** *Journal of atmospheric chemistry,* 1984 1(3), p.215-239, Refs. p.237-239.

Simultaneous measurements of soluble and insoluble impurities were made on the 950 m deep Vostok ice core, spanning roughly 50,000 years. Higher continental and marine inputs during the last glacial age than during the Holocene stage were observed. A study of microparticle compositions and of volcanic indicators shows that the high observed crustal input is not due to enhanced volcanism, but is rather of continental eolian origin. For the first time, the ionic balance along a deep ice core is established, mainly used in discussing the evolution of the Cl to Na ratio over central East Antarctica with changing climatic conditions. Comparison with the Dome C results confirms the chronology of the major events: maximum terrestrial input around the last glacial maximum; end of the high continental flux over Antarctica near 13 ka bP; marine input varying in an opposing manner to isotopic fluctuations with rather high concentrations beginning to decrease when isotopic values increase and reaching Holocene values at the end of the transition between cold and warmer climate conditions. It is concluded that central East Antarctica should provide valuable data for global and Antarctic paleoclimatological models. (Auth. mod.)

Raper, S.C.B., Wigley, T.M.L., Mayes, P.R., Jones, P.D., Salinger, M.J., **Variations in surface air temperatures. Part 3: The Antarctic. 1957-82,** *Monthly weather review,* July 1984 112(7), p.1341-1353, 34 refs.

Gridded monthly data were used to calculate monthly values of the spatial mean temperature south of 65 S. The uncertainty in the area average is estimated to be 0.22 C for the annual values prior to 1970. After 1970 there is an additional uncertainty of about 0.10-0.16 C due to the closing of Byrd Station. The annual mean and summer areal averages show significant linear warming trends amounting to 0.74 and 0.77 C respectively. Spatial characteristics of the annual and seasonal temperature variations are described using principal components analysis of the station anomaly data. The first two principal components of the annual and winter data are similar; PC1-winter is also similar to the winter pattern for linear trend found by van Loon and Williams for 1956-73. The warming trend associated with this pattern ceased in the mid-1970s. Relationships between antarctic temperatures and various parameters are investigated using linear trend and correlation analyses. Antarctic temperatures cannot be inferred from the long Orcadas record and the relationships between antarctic temperatures and sea ice extent are complex. The most significant correlations between mean antarctic temperature and sea ice extent averaged around Antarctica are found in spring; warm springs tend to be associated with anomalously large maximum sea ice extent. Lower antarctic temperatures occur during summers and winters with strong westerlies (significant at the 0.1% level in summer and at the 1% level in winter). (Auth.)

Fleming, D.A., **Antarctic automatic weather stations as forecasting aids,** *Antarctic journal of the United States,* 1983 18(5), p.302-303.

The importance of automatic weather stations as forecasting aids in the Ross Island region is discussed. Fog seems to be the most difficult weather event to forecast for Williams Field and the ice runway. A close look at dense fog occurrences during the period from Nov. 1, 1982 to Jan. 31, 1983 revealed a strong correlation between a wind within the southeast quadrant at Ferrel Station (8907) and dense fog at Williams Field. Observations indicate that moisture advection into the Williams Field region occurs when the surface flow backs into the southeast quadrant in the region of station 8907. The fog often occurs 3 to 8 hours (or more) after the wind shift.

Walton, D.W.H., **Terrestrial environment,** Antarctic ecology, R.M. Laws, ed., London, Orlando, Academic Press, 1984, p.1-60, Bibliography p.51-60.
DLC QH84.2.A58 1984

The geography of the Antarctic has been pieced together from the efforts of many nations over more than 200 years. Good topographical maps cover all of the continent and other maps in preparation show sub-ice details. A growing body of maps showing various hypotheses on the geological evolution of Gondwanaland to the present distribution of land in the southern hemisphere is the result of attempts to unite data from various disciplines into a common theory. Amidst the data and speculation of these other scientific disciplines there is much of great use to the biologist. Reviewed in this chapter are elements in climatology, geography, meteorology and pedology, which are of importance in a biological context with suggestions of some profitable lines for future research in these fields. (Auth.)

Hoffman, J.S., Keyes, D., Titus, J.G., **Projecting future sea level rise. Methodology, estimates to the year 2100, and research needs,** Washington, U.S. Environmental Protection Agency, Oct. 1983, 121p., EPA 230-09-007, 2nd revised edition. Numerous references.

It is reported that concentrations of greenhouse gases will almost certainly double in the next century. The possibility of deglaciation as a source of land-to-sea transfer of snow and ice is discussed. The vulnerability of the West Antarctic ice sheet to such deglaciation is pointed out. Methods to estimate the potential contributions of ice and snow to sea level are presented. Numerous tables, including the distribution of ice and snow on land and sea in both hemispheres, estimates of global sea level rise and the categories of decisions such a rise will influence, are shown. Research needed to improve understanding of snow and ice melting, oceanic warming around Antarctica, and glacial ice discharge, is outlined.

Koshel'kov, IU.P., **Climatology of the middle atmosphere of the Southern Hemisphere,** *Journal of atmospheric and terrestrial physics,* Sep. 1984 46(9), p.781-798, 55 refs.

Main features of spatial distribution and time variations of meteorological parameters in the Southern Hemisphere at altitudes 25-80 km are reviewed on the basis of zonal empirical models revised in 1982. Meridional distribution and seasonal variations are analysed. For comparison purposes with the Northern Hemisphere, a model developed in 1978 is used. Meridional distribution of the parameters in summer is characterized by higher values of temperature, pressure and density gradients in the stratosphere of the Southern Hemisphere than in that of the Northern Hemisphere. This resulted in greater advancement of the core of the summer-time easterly flow towards the equator in the Southern Hemisphere than in its northern counterpart. In the wind field, specific features of the Southern Hemisphere westerly flow are high intensity and relatively low altitude of the maximum speed as compared to the Northern Hemisphere. In summer, temperature and pressure fields based on satellite data are symmetric relative to the poles in both hemispheres. In winter, the distortion of the mean pressure field in the mesosphere may be as great in the Southern as in the Northern Hemisphere. (Auth. mod.)

Yamanouchi, T., Kawaguchi, S., **Longwave radiation balance under strong surface inversion in the katabatic wind zone, Antarctica,** *Journal of geophysical research,* Dec. 20, 1984 89(D7), p.11,771-11,778, 27 refs.

Measurements and calculations of longwave radiation fluxes, to clarify their characteristic features under a surface inversion and with katabatic winds, were made at Mizuho Station in the 1978-1979 season. Direct measurements of the downward and upward longwave fluxes were extended through day and night using pyrgeometers with a simple shading ring to cut off heating by direct solar radiation. Longwave radiation fluxes were calculated using a simple wind band model, and the effect of the surface inversion was examined. The daily average of the downward flux varies greatly between 90 and 240 W/sq m. The large day to day variation is due to clouds. Overcast skies give an increase of about 80 W/sq m in the downward longwave flux in all seasons. The effective emissivity of the atmosphere for clear sky is very small on account of the small amount of column water vapor. The drifting snow near the surface caused by the strong wind increases the downward longwave flux and suppresses the longwave cooling at the surface. The relation between the strength of the surface inversion and longwave fluxes is examined and approximated by a linear relation. When the surface inversion becomes strong, the net longwave flux decreases. (Auth.)

Hervey, S.P., **Study of antarctic remote site automatic weather station data (1980-81) from the Ross Ice Shelf area,** Monterey, Naval Postgraduate School, March 1984, 170p., ADA-143 738, Master's thesis. 9 refs.

The third generation of the Antarctic remote-site Automatic Weather Stations (AWS2B) was installed at various locations during austral summer (1979/80). The quality and quantity of surface pressure, wind (speed and direction) and temperature data show a marked improvement over that of the earlier AWS platforms (1976-80) examined by personnel at the Naval Postgraduate School. Statistical processing of data from February 1980 to December 1981 was done in order to contribute to a base climatology for AWS sites and to investigate possible operational applications of the data to the United States Antarctic mission. Comparisons were made between synoptic reports collected at McMurdo, Antarctica and the data obtained from the surrounding AWS2B stations. (Auth.)

National Research Council. Committee on Glaciology, **Environment of West Antarctica: potential CO2-induced changes: report of a workshop held in Madison, Wisconsin, 5-7 July 1983,** Washington, D.C., National Academy Press, 1984, 236p., PB85-110 757, Numerous refs. For individual papers see 39-1499 through 39-1510 or F-31103, F-31106, F-31110, F-31114, I-31104, I-31105, I-31107 through I-31109, I-31111, I-31112 and J-31113.

It has been suggested that a rapid reduction of the ice mass of West Antarctica leading to a drastic rise in sea level might result from CO2-induced warming. Climate factors that provide the principal external forcing for glacial ice of West Antarctica are examined. Topics discussed include: historical changes of atmospheric CO2 and other environmental variables; changes in polar ice sheets; knowledge of the present state of the environment of West Antarctica; model simulations of the present environment; and model predictions of potential CO2-induced changes. Recommendations are made for improving existing data sets and testing and improving model simulations of the atmospheric environment. (Auth.)

Trenberth, K.E., **Atmospheric circulation affecting the west antarctic region in summer,** Environment of West Antarctica: potential CO2-induced changes; report of a workshop, July 1983, Washington, D.C., 1984, p.73-87, PB85-110 757, 12 refs.

A series of charts and graphs of the Southern Hemisphere circulation is discussed in the text. Parameters of these visual displays include, among others: geostrophic wind in cross section; mean geopotential height fields at 500 mb; 1000-500 mb thickness field; geostrophic westerly wind component at 500 mb; locations of maximum occurrences of various phenomena related to storm frequency. The erratic nature of rawinsonde data for many of the antarctic stations is pointed out as a reason for lack of understanding of weather processes on and near the continent.

Flohn, H., **Hemispheric circulation asymmetry during Late Tertiary,** *Geologische Rundschau,* May 1981 70(2), p.725-736, In English with German, French and Russian summaries. Refs. p.735-736.

DLC QE1.G4917

Recent data obtained within the Deep Sea Drilling Project in the southern oceans revealed that the formation of antarctic sea-ice started 38 m.y.b.p. ago at the beginning of the Oligocene. The antarctic ice-cap reached nearly its present volume during the Middle Miocene (14-12 m.y.b.p.) and a volume greater than the present during the Messinian (6-5 m.y.b.p.). This evolution indicates a period of about 10 m.y. during which East Antarctica was highly glaciated, while the Arctic Ocean was essentially ice-free. This asymmetric pattern is compared with the present asymmetry (unipolar versus bipolar glaciation); the annually averaged position of the "meteorological equator" had then displaced from about Lat. 6 deg N today to about 10 deg N. Some estimates of the heat budget terms in polar latitudes at a glaciated continent and at an ice-covered ocean are given. A preliminary review of paleoclimatic data reveals significant shifts of the position of the climatic belts at both hemispheres. (Auth. mod.)

Schaller, E., **MEFIS—a mesoscale meteorological experiment in the edge area of the Filchner Ice Shelf** [MEFIS—ein mesoskaliges meteorologisches Experiment im Kantenbereich des Filchner Schelfeises], *Bremerhaven, Germany. Alfred-Wegener-Institut für Polarforschung. Berichte zur Polarforschung,* Nov. 1984 No.19, p.165-171, In German.

The experiment, conducted by three institutions having meteorological programs, was undertaken over a period of about one month. The objective was to gather near-surface atmospheric data in the vicinity of the edge of the ice shelf over a horizontal range of about 40-45 km. This was done by setting out a network of automatic sensors which measured temperature, humidity, wind speed and direction. Analyses of the data will be used to assess boundary layer problems of temperature discontinuities, daily energy variations, and case studies of lower atmosphere disturbances. Discussions and charts deal with gathering of the data and the uses to which they will be put.

Robinson, E., Bamesberger, W.L., Menzia, F.A., Waylett, A.S., Waylett, S.F., **Atmospheric trace gas measurements at Palmer Station, Antarctica: 1982-83,** *Journal of atmospheric chemistry,* 1984 2(1), p.65-81, 16 refs.

In early 1982 a station capable of sampling atmospheric trace gas constituents on a continuous basis was established at Palmer Station. Sampling operations began about February 1, 1982. This is an initial report on this station, its location, equipment and general research objectives along with some initial sampling results. The constituents being measured and recorded were: ozone, methane, carbon dioxide, carbon monoxide, fluorocarbon-11, fluorocarbon-12, carbontetrachloride, methylchloroform, nitrous oxide, and Aitken nuclei (CN). Data storage, data processing, and sampling system control is handled by a Hewlett-Packard 85 system. Preliminary analyses of about the first 20-22 months of data are presented and show not only the expected long-term trends but also shorter period concentration cycles that seem to be related to synoptic meteorology. (Auth.)

North, G.R., Mengel, J.G., Short, D.A., **Two-dimensional climate model useful in ice age application,** NATO ASI Series C: Mathematical and physical sciences, Vol. 126, Milankovitch and climate. Edited by A. Berger, J. Imbrie, J. Hays, G. Kukla, and B. Saltzman, Dordrecht, D. Reidel, 1982, p.513-518, 18 refs.

DLC QC884.N185

The present model which is easily and efficiently solved should prove useful for future studies coupling a simple climate model with a deluxe ice sheet model. The climate model already has the property that glaciers have the potential for growing in the right places and with a reasonable sensitivity (especially with the assistance of CO2 changes). The model in its present form has some rich mathematical structure associated with geography leading to abrupt transitions in ice area as parameters are slowly varied.

Broecker, W.S., **Terminations,** NATO ASI Series C: Mathematical and physical sciences, Vol. 126, Milankovitch and climate. Edited by A. Berger, J. Imbrie, J. Hays, G. Kukla, and B. Saltzman, Dordrecht, D. Reidel, 1982, p.687-698, 22 refs.

DLC QC884.N185

The coincidence between the termination of major glaciations in the northern and southern hemispheres is not easily explained. The association between these events and peaks in Northern Hemisphere seasonality suggests that these rapid warmings are linked to the earth's orbital cycles. The lack of correlation between terminations and the seasonality record for the Southern Hemisphere suggests that the Southern Hemisphere terminations must have been driven by events in the Northern Hemisphere. The global sea level rise associated with the melting of the large Northern Hemisphere ice sheets does not appear to be the link because the events in the Antarctic Ocean clearly led the O18 change in the sea. Large changes in the pattern of deep sea ventilation or CO2 changes in the atmosphere seem to be the agents of interhemispheric transmittal of the climatic message. (Auth. mod.)

Young, M.A., Bradley, R.S., **Insolation gradients and the paleoclimatic record,** NATO ASI Series C: Mathematical and physical sciences, Vol. 126, Milankovitch and climate. Edited by A. Berger, J. Imbrie, J. Hays, G. Kukla, and B. Saltzman, Dordrecht, D. Reidel, 1982, p.707-713, 12 refs.

DLC QC884.N185

Hemispheric insolation gradients play an important role in driving the global atmospheric circulation, and may have contributed to the growth and decline of continental ice sheets by modulating the transport of moisture to high latitudes. Mid-monthly insolation differences between 30 and 90 deg latitude in each hemisphere were computed at 1000 years intervals for the past 150,000 years. Times of rapid ice build-up correspond to a distinctive seasonal pattern of insolation gradient deviations, with generally high gradients throughout the year, and follow closely times of strong autumn insolation gradients. The opposite patterns are observed at times of ice wastage. (Auth.)

Royer, J.F., Deque, M., Pesiaux, P., **Sensitivity experiment to astronomical forcing with a spectral GCM: simulation of the annual cycle at 120,000 BP and 115,000 BP,** NATO ASI Series C: Mathematical and physical sciences, Vol. 126, Milankovitch and climate. Edited by A. Berger, J. Imbrie, J. Hays, G. Kukla, and B. Saltzman, Dordrecht, D. Reidel, 1982, p.733-763, 21 refs.

DLC QC884.N185

The primary response of the atmosphere to the anomalies in the distribution of incident solar radiation by latitude and season introduced by the secular variations of the Earth's orbital elements (other boundary conditions being specified) was investigated. The annual cycle of climate at 125,000 years BP and 115,000 years BP was simulated. The physical parameterizations of the model include a simplified radiative scheme with diurnal variation of insolation, interactive cloudiness based on relative humidity, detailed hydrologic cycle and surface processes with computation of soil temperature, water content and snow cover. Two simulations of a complete annual cycle were compared. Differences between the statistics of the two experiments show a characteristic response of the atmospheric temperatures and circulation to the insolation anomaly. (Auth. mod.)

Sellers, W.T., **Response of a climate model to orbital variations,** NATO ASI Series C: Mathematical and physical sciences, Vol. 126, Milankovitch and climate. Edited by A. Berger, J. Imbrie, J. Hays, G. Kukla, and B. Saltzman, Dordrecht, D. Reidel, 1982, p.765-788, 13 refs.

DLC QC884.N185

A three-dimensional global climate model is used to study the response of the earth-atmosphere system to variations in the earth's orbit about the sun. Three different sets of orbital parameters are used in computer runs of 20 model years. The results indicate that the greater the summer insolation, the greater the temperature difference and the stronger and more dependable the monsoon circulation and its attendant summer rainfall. The model snow cover and sea ice area vary only slightly with changes in the orbital parameters, possibly because of deficiencies in the model. (Auth. mod.)

Manabe, S., Broccoli, A.J., **Influence of the CLIMAP ice sheet on the climate of a general circulation model: implications for the Milankovitch theory,** NATO ASI Series C: Mathematical and physical sciences, Vol. 126, Milankovitch and climate. Edited by A. Berger, J. Imbrie, J. Hays, G. Kukla, and B. Saltzman, Dordrecht, D. Reidel, 1982, p.789-799, 15 refs.
DLC QC884.N185

This study investigates the influence of the 18 kyr BP ice sheet on the earth's climate by use of a mathematical model which consists of three basic units: a general circulation model of the atmosphere, a heat and water balance model over the continents, and a simple model of the oceanic mixed layer. A brief description of these three units is given. The results of the study suggest that the effects of increased continental ice extent alone are insufficient to explain the glacial climate of the Southern Hemisphere.

Hidaka, H., **Environmental pollution of chlorinated hydrocarbons in the Antarctic,** *Polar news,* Feb. 1984 No.38, p.9-14, In Japanese.

DDT and PCB levels in air, snow, seawater, marine invertebrates, fish, Weddell seals etc. collected by the 22nd JARE (1980-1982) around Showa Station were determined and the bioaccumulation and environmental dynamics of these chemicals in the Antarctic are discussed. Concentration levels of DDT and PCBs in the antarctic marine ecosystem are much lower than those in the other oceans. The low concentration of these chemicals in seawater under antarctic fast ice may be caused by characteristics of the antarctic environment, such as isolation from the outer world, ice covering, and high bioproductivity in austral summer among others. Additionally, specific characteristics of environmental pollution by chlorinated hydrocarbons in the Antarctic are discussed.

Rycroft, M.J., **Atmospheric research in Antarctica,** Fundamental studies and the future of science, edited by C. Wickramasinghe, University College Cardiff Press, 1984, p.285-300, 10 refs.
DLC Q158.5.F86 1984

The particular advantages to be gained by studying atmospheric sciences in and around Antarctica stem from two facts. The first is that Antarctica is a cold, high dome entirely surrounded by oceans. Thus, from the viewpoints of meteorology and climatology, the situation is markedly different from that in the Arctic. The stratospheric polar vortex over Antarctica persists until the late spring whereas, in the North, breakdowns can occur as early as mid-winter, with a weaker vortex usually reforming after such early breakdowns. The second fact is that the geomagnetic dip pole is twice as far from the geographic pole in the South as it is in the North. Thus the behavior of the ionosphere, driven by forces of magnetospheric origin, is different in the two hemispheres. Some examples of results obtained at three British Antarctic Survey bases which illustrate such points are presented and put into global context within the field of solar-terrestrial physics. (Auth.)

Hofmann, D.J., Rosen, J.M., **Antarctic observations of stratospheric aerosol and high altitude condensation nuclei following the El Chichon eruption,** *Geophysical research letters,* Jan. 1985 12(1), p.13-16, 19 refs.

A balloon sounding to 32 km altitude was conducted at the U.S. station on McMurdo Sound in Antarctica in October 1983. The purpose was to determine the extent to which sulfuric acid aerosol from the April 1982 eruption of the Mexican volcano El Chichon had affected the Antarctic stratospheric aerosol layer and if sulfuric acid condensation nuclei are produced at high altitude in the Antarctic stratosphere as had been observed in the Northern Hemisphere during the late winter - early spring period. The results indicate that stratospheric transport to the south polar region was very effective with aerosol mixing ratios observed to be similar to those in the Northern Hemisphere for the same time period. Observation of relatively high concentrations of condensation associated temperature variations tend to support the validity of an aerosol production process proposed to explain earlier Northern Hemisphere results. Bacastow, R., **Influence of the southern oscillation on atmospheric carbon dioxide,** Fate of fossil fuel CO2 in the ocean. Edited by N.R. Andersen and A. Malahoff, New York, Plenum Press, 1977, p.33-43, 21 refs.
DLC GC117.C37F37

The atmospheric CO2 record at the South Pole, after the seasonal effect is removed, reveals a small anomaly with a period of three to four years and an amplitude of about one part per million. The rate of change of this anomaly, and the corresponding anomaly at Mauna Loa, Hawaii, correlate well with the usual index of the Southern Oscillation. The correlations indicate that CO2 is removed from the atmosphere at times of stronger than average trade winds and Mid Latitude Westerlies. It is suggested that CO2 enters the Southern Mid Latitude oceans more rapidly during times of increased Westerlies. A more complete explanation of the relationship implied by the correlation should aid our understanding of how and where fossil fuel CO2 enters the oceans. (Auth. mod.)

Flohn, H., **Major climatic events associated with a prolonged CO2-induced warming,** Oak Ridge, Associated Universities, Oct. 1981, 80p., DE82 004909, Refs. p.71-80.

Two climatic events are possible if CO2 concentrations reach levels above 600 ppM, and if other greenhouse gases increase simultaneously, leading to an increase in global average temperature. One event, the disintegration of the West Antarctic ice sheet, last occurred about 120 thousand years ago, the other, the disappearance of the shallow drift ice in the Arctic Ocean, last occurred about 2.4 million years ago. Although this suggests that the West Antarctic ice is more fragile than the Arctic sea ice, the events may occur in the opposite order. The disappearance of the Arctic sea ice would constitute a case of unipolar glaciation. Paleoclimatic evidence suggests that the earth has experienced long periods of unipolar glaciation and that the effects of such radical asymmetry on global climate would be far-reaching. (Auth. mod.)

Robinson, E., Clark, D., **Latitudinal distribution of carbon monoxide across the Pacific from California to Antarctica,** *Journal of atmospheric chemistry,* 1984 1(2), p.137-149, 27 refs.

Results of a program of mid-tropospheric CO measurements aboard an LC130 airplane are reported. The data both extend and support other research studies of the latitudinal distribution of carbon monoxide in that higher concentrations are evident over the Northern than over the Southern Hemisphere. Carbon monoxide concentrations range between 50 and 60 ppb with a few peaks into the 60s in the latitudinal area south of the ITCZ and values of 80 ppb or higher at latitudes north of Hawaii. A comparison is also made of carbon monoxide and ozone concentrations along the flight tract between California and Antarctica, over the Ellsworth Mountains of Antarctica, and between 78 S and the South Pole. These ozone-carbon monoxide data show statistically significant negative correlations in the upper troposphere and lower stratosphere over Antarctica. It is believed that this is a good indication of mixing across the tropopause. (Auth.)

Wendler, G., Kodama, Y., **On the climate of Dome C, Antarctica, in relation to its geographical setting,** *Journal of climatology,* Sept.-Oct. 1984 4(5), p.495-508, 34 refs.

The annual course of temperature displays the typical "coreless" winter phenomenon, with no systematic temperature changes for 4 to 5 months, and mean temperatures of about -60 deg C during this time. The wind speeds observed at Dome C were the lightest, not only of all interior stations in Antarctica, but of all antarctic stations, including coastal and near-coastal ones. This illustrates the well-known dependence of the katabatic winds on slope angles and topography. Despite steep and deep surface inversions, katabatic winds generated at higher elevations on the continental slopes do not appear to override Dome C, but flow around it. By contrast, the winds observed in the coastal regions of Adélie Land, some 1000 km away from Dome C, belong to the strongest found anywhere on earth. (Auth. mod.)

Mognard, N.M., Campbell, W.J., **Comparison of sea surface wind speed fields by SEASAT radar altimeter, scatterometer, and scanning multichannel microwave radiometer, with an emphasis on the southern ocean,** European Space Agency, ESA SP-215, International Geoscience and Remote Sensing Symposium (IGARSS '84), Strasbourg, Aug. 27-30, 1984. Proceedings. Remote sensing—from research towards operational use, Paris, Aug. 1984, p.403-409, 20 refs.

Three of the microwave sensors on board the SEASAT satellite, the altimeter (ALT), the scatterometer (SASS), and the scanning microwave multichannel radiometer (SMMR) measured the sea surface wind speed. During the satellite lifetime from June to October 1978, the Austral winter, the highest wind speeds were recorded in the southern ocean. Three-month, monthly, and three-day surface wind speed fields deduced from the three SEASAT wind speed sensors are analysed and compared. The monthly and three-day fields show a pronounced mesoscale (1000 km) variability in wind speed. At all space and time scales analyzed, differences of about 40% are found in the magnitude of the wind speed features, with the ALT consistently yielding the lowest wind speed and the SMMR the highest.

Cerni, T.A., Parish, T.R., **Radiative model of the stable nocturnal boundary layer with application to the polar night,** *Journal of climate and applied meteorology,* Nov. 1984 23(11), p.1563-1572, 33 refs.

A graybody, longwave, radiative transfer model based on revised estimates of the absorption characteristics of CO2 and H2O is proposed. The model is computationally efficient and is designed for use within larger mesoscale primitive equation models. Tests have shown that the graybody model accurately simulates atmospheric heating rates as predicted by more detailed radiation models. When incorporated within a simple one-dimensional model, the radiation parameterization provides realistic simulations of the strong temperature inversion over the interior of Antarctica in winter. (Auth.)

Görlach, U., Wagenbach, D., Kipfstuhl, J., Stuckenberg, U., **Glaciological trace element investigations at German antarctic stations** [Spurenstoff-glaziologische Untersuchungen an den deutschen Antarktisstationen], Filchner-Ronne Ice Shelf programme, Report 2 (1985), H. Kohnen, comp, Bremerhaven, Alfred Wegener Institute for Polar Research, 1985, p.42-49, In German with English summary.

Surface snow, ice cores and aerosol samples in the vicinity of G. v. Neumayer Station were analyzed to learn of the seasonal pattern as well as the lateral and vertical distribution of sea salt deposition. A maximum sea salt production in the austral autumn could be detected clearly in aerosol and dated snow samples. Caused by the small distance to the open ocean surface, extremely high sea salt concentrations (up to 200 mg/kg) are a common phenomenon. Apart from this local effect, it is expected that a combination of stable isotope (O-18, D) and sea salt measurements in snow samples can help to identify different drainage areas of antarctic ice shelves. (Auth.)

Kottmeier, C., **Flow models in katabatic winds** [Strömungstypen bei katabatischem Wind], Filchner-Ronne Ice Shelf programme, Report 2 (1985), H. Kohnen, comp, Bremerhaven, Alfred Wegener Institute for Polar Research, 1985, p.86-96, In German with English summary. 2 refs.

Based on measurements during the meteorological program MEFIS of the Filchner Ice Shelf Expedition 1984, the drainage wind over the Filchner Ice Shelf is discussed. Theoretical considerations and the measurements show that significant drainage winds are not caused by the ice surface inclination alone. A mechanism is pointed out, which relates the observed katabatic wind to different thermal structures of the atmosphere over the inner shelf ice and the marginal zone. (Auth.)

Mattern, G., **On a sferics-induced emission in the VLF range** [Über eine von Sferics ausgelöste Emission im VLF-Bereic[illegible] Filchner-Ronne Ice Shelf programme, Report 2 (1985), H. Kohnen, comp, Bremerhaven, Alfred Wegener Institute for Polar Research, 1985, p.113-117, In German with English summary. 3 refs.

Observing the sferics in the VLF range, one can hear the so called "tweek", a special form of sferics at middle latitudes nearly every second night. Closer investigation on tweeks shows that not only line wave guide dispersion leads to the generation of the tweeks. During those nights, in most cases the sferics of far away thunderstorms are connected to emissions triggered by sferics. That emission follows the beginning of the sferic after two to six milliseconds. The amplitudes are commonly smaller than those of the tweeks and usually only a small band in the audio frequency range is stimulated. According to the introductory results of a journey by the FS *Polarstern* from Bremerhaven to Rio de Janeiro the biggest time lag is observed at the equator area. Measurement at Georg von Neumayer Station in the Antarctic shows that this phenomenon is rarer there and that time lag is only about one millisecond. (Auth.)

Pleshcheev, IU.G., Frolov, V.I., **Radar measurements of atmospheric precipitation in Antarctica** [Izmerenie osadkov v Antarktide s pomoshch'iu MRLS], Radiolokatsionnaia meteorologiia (Radar meteorology) edited by V.D. Stepanenko and G.B. Brylev, Leningrad, Gidrometeoizdat, 1984, p.64-67, In Russian. 9 refs.

Precipitation in coastal Antarctica is basically of cyclonic nature. Snowfall is usually accompanied by strong winds complicating the traditional methods of measurement. Radar techniques were used for measuring snow accumulation over large areas. Coefficients of dependence of radar reflections on snowfall intensity were obtained for fine dry snow during passage of antarctic-front cyclones and correction coefficients for wind error were established for the Tretiakov precipitation gage.

DLC QC11.J6

Atmospheric monitoring stations are operated at Barrow, Alaska; Mauna Loa, Hawaii; American Samoa; and South Pole by the Geophysical Monitoring for Climatic Change program to measure the characteristics of gaseous and aerosol species under background conditions. A nearly continuous record of light-scattering coefficient and condensation nuclei concentration measurements is available for Barrow since 1971, Mauna Loa since 1974, Samoa since 1977, and South Pole since 1974. The South Pole light-scattering data show a complicated annual cycle with a maximum in the austral summer and a minimum about April. The austral winter is dominated by events most likely caused by the transport of sea salt in the troposphere from the coastal regions to the interior of the antarctic continent. The South Pole condensation nuclei data show a repeatable annual cycle with a maximum in the austral summer and a minimum in the austral winter. Linear least squares trend analyses show no significant trend compared to the standard error about the regression line at any station. (Auth. mod.)

Cleveland, W.S., Freeny, A.E., Graedel, T.E., **Seasonal components of atmospheric CO2: information from new approaches to the decomposition of seasonal time series,** *Journal of geophysical research,* Dec. 20, 1983 88(C15), p.10,934-10,946, Refs. p.10,945-10,946.

DLC QC811.J6

CO2 concentration data in the atmosphere are widely known to possess a seasonal cycle, largely due to plant photosynthesis and respiration, superimposed upon an upward trend that is largely due to increasing fossil fuel use. In this paper we assess the information contained in the seasonal component of atmospheric CO2 data by applying modern techniques of time series decomposition to monthly average CO2 observations at three locations. At Mauna Loa and South Pole, which have the longest time series, the amplitudes of the seasonal components are found to be increasing with time, from 5.6 ppm in 1958 to 6.2 ppm in 1978 at Mauna Loa and from 10 ppm in 1965 to 1.3 ppm in 1978 at the South Pole. We consider four possible causes of the CO2 seasonal behavior—changes in the seasonal pattern of fossil fuel use, increasing vegetation, increasing global photosynthetic activity, and changes in ocean temperature—and conclude that it is most likely that the CO2 seasonal behavior reflects an increase in global photosynthetic activity. Venne, D.E., **Horizontal structure of traveling planetary-scale waves in the upper stratosphere,** *Journal of geophysical research,* Apr. 20, 1985 90(D2), p.3869-3879, Refs. p.3878-3879.

The temperature amplitude and phase structures of zonally propagating planetary waves are determined between 79S and 79N latitudes at 10 and 1 mbar levels through the use of spectral analysis and complex-valued empirical orthogonal function analysis. The data are temperatures regressed from Nimbus 4 and 5 satellite infrared radiances during the solsticial seasons of 1970-1974. The structures of three westward moving normal modes and two eastward moving modes linked to instabilities near the winter stratopause are described. Waves of zonal wavenumber 4, 5, and 6 which are eastward moving in the summer Southern Hemisphere are also observed; a wave 1, 16-day period, westward moving mode commonly observed in geopotential fields is not seen here. The results concur with recent studies of traveling waves and provide estimates of average wave temperature amplitudes in the upper stratosphere. (Auth.)

Zillman, J.W., Johnson, D.R., **Thermally-forced mean mass circulations in the Southern Hemisphere,** *Tellus,* Jan. 1985 37A(1), p.56-76, 52 refs.

The three-dimensional distribution of the thermally-forced time-averaged horizontal mass transport in isentropic coordinates is determined. The model, based on the time-averaged isentropic continuity equation, treats horizontal mass transport, mass transport potential, and Southern Hemisphere heating fields. The results highlight the role of radiative cooling over the cold elevated Antarctic ice cap, sensible heat flux from the warm circumpolar ocean and, in particular, the zonal and meridional contrasts of latent heat release in forcing large-scale mean mass circulations in the Southern Hemisphere. The inferred mass circulations include strong meridional and zonal components in the tropical belt extending into the middle and high latitudes of the Southern Hemisphere. Of particular interest is a large toroidal mass circulation cell transporting heat away from the heavy rainfall belt lying southeast from Papua-New Guinea. (Auth. mod.)

Workshop on Paleoclimatic research and models, Brussels, December 15-17, 1982, Ghazi, A., ed, **Paleoclimatic research and models,** Dordrecht, D. Reidel, 1983, 205p., Refs. passim. For selected papers see 39-3145 through 39-3150 or F-31741, I-31740 and I-31742.

DLC QC884.P34

About 35 paleoclimatologists from 10 countries participated in the workshop to discuss and identify abrupt climate changes, initiation of glaciation, and glaciated polar regions and their impact on global climate. This volume contains the outcome of the workshop in the form of full texts or summaries of the presentations, three of which deal with Antarctica.

I-31740

Flohn, H., **Actual paleoclimatic problems from a climatologist's viewpoint,** Paleoclimatic research and models: report and proceedings of the workshop held in Brussels, December 15-17, 1982. Edited by A. Ghazi, Dordrecht, D. Reidel, 1983, p.17-33, Refs. p.27-29.

DLC QC884.P34

Reviewed are the Little Ice Age, the Late Glacial and Early Holocene, the building and decay of the Last Glacial, the Last Interglacial, and the ice-free Arctic versus glaciated Antarctic in the late Cenozoic. The essential paleoclimatic facts are summarized. Some examples from the transition from Late-Glacial to Early-Holocene are discussed as of possible use for further research.

Hills, T.S., **Sensitivity of general circulation models,** Paleoclimatic research and models: report and proceedings of the workshop held in Brussels, December 15-17, 1982. Edited by A. Ghazi, Dordrecht, D. Reidel, 1983, p.181-192, 6 refs.

DLC QC884.P34

A number of experiments with atmospheric general circulation models to investigate the effect on the modelled atmosphere of changing the prescribed sea-ice cover are reviewed. The Simmonds (1979) experiment using a model of the Southern Hemisphere, run using mean September ice conditions and repeating the integration using March ice conditions instead, is confirmed by an experiment where July to September of one annual cycle integration with a 5-level general circulation model was repeated with antarctic sea ice removed north of 60 S.

University of East Anglia, Climatic Research Unit, **Climate monitor, Vol. 13, No.5, Annual 1984,** Norwich, UK, [1985], 29p.

In this booklet major climate events in numerous countries throughout the world are summarized and an article is included predicting that global increases in carbon dioxide will continue, resulting in additional atmospheric warming during the next few decades. Data for Antarctica for 1984 include Southern Hemisphere 500 mb anomalies for May, surface temperature anomalies on the continent, and the 1957-1980 mean annual temperature, the 1984 value, and the 1984 anomaly at 26 antarctic stations.

Arzhanova, N.V., **Si/P ratio as indicator of the mixing zone around the South Orkney Islands and the Antarctic Peninsula** [Otnoshenie soderzhaniia kremniia i fosfora (Si/P) kak pokazatel' zony smesheniia vod v oblasti IUzhnykh Orkneĭskikh ostrovov i Antarkticheskogo poluostrova], *Antarktika; doklady komissii,* 1982 No.21, p.95-100, In Russian. 17 refs.

Principles of distribution and ratio of silicon and phosphorus (Si/P) contents, and their determining factors, were studied in the Atlantic and the Pacific sections of the antarctic ocean. It is found that the Antarctic Circumpolar Current and high latitude modifications sharply differ in vertical and spatial Si/P distribution. A constant criterion of 20 to 30-35 Si/P was found in the mixing zone which corresponds to the maximum horizontal Si/P gradient. The distribution of Si/P content accurately reflects the basic configuration line of the mixing zone, allowing to evaluate water conditions in relation to bioproductivity.

Fröhlich, F., **Paleogene and late Cretaceous pelagic sedimentary sequence of the Kerguelen plateau: preliminary results of the MD 35/D.R.A.K.A.R. cruise aboard the *Marion Dufresne* (March 1983)** [Mise en évidence d'une série sédimentaire pélagique du Paléogène et du Crétacé Supérieur sur le plateau de Kerguelen: résultats préliminaires de la campagne océanographique MD 35/D.R.A.K.A.R. (mars 1983) du N.O. *Marion Dufresne*], *Académie des sciences, Paris. Comptes rendus hebdomadaires des séances. Série 2,* Sept. 19, 1983 297(2), p.153-156, In French with English summary. 7 refs.

The sedimentary basin of the Kerguelen-Heard plateau was sampled during the *Marion Dufresne* cruise MD35. As seen on seismic profiles, it consists of two distinct units. In the lower unit, chalks, calcareous oozes, pelagic limestones with flints and cherts were cored and dredged. The top age of this unit is middle Eocene, the oldest sediments cored being of late Cretaceous age. Only the top of the upper unit, nannos and Forams oozes and diatomites, were cored, Miocene to late Pleistocene in age. Older calcareous oozes (late Eocene to early Oligocene) have been found near the northern boundary of the ridge. Therefore, the sedimentary sequence from the Kerguelen ridge appears to have an oceanic origin, and was initiated at least at the beginning of the late Cretaceous, just after the opening of the Indian ocean. Brake, C.F., Anderson, J.B., **Bathymetry of the North Victoria Land continental margin,** *Marine geodesy,* 1983 6(2), p.139-147, 17 refs.

The very unique continental margin of North Victoria Land is characterized by complex bathymetry, reflecting control by glacial, tectonic, and marine processes. The abnormally shallow shelf can be divided into a deep, rugged, glacially dominated inner shelf and a smoother, shallower outer shelf, which is dominated by marine and glacial marine processes. Deep u-shaped glacial troughs incise the shelf, while relict v-shaped canyons incise the upper slope. Trending northwest-southeast along the eastern edge of the area lies a rugged chain of seamounts representing the southern extension of the Balleny Fracture Zone. The continental slope is dominated by strong contour currents and gravity processes. (Auth.)

Dubinets, G.A., Fesiumov, O.E., Trofimov, M.N., **Main geomorphological characteristics of the Sodruzhestvo Sea bottom** [Osnovnye cherty geomorfologii dna v raĭone moria Sodruzhestva], Antarkticheskiĭ kril'. Osobennosti raspredeleniia i sreda. Edited by T.G. Liubimova, R.R. Makarov, and E.A. Kamenskaia, Moscow, Legkaia i Pishchevaia Promyshlennost', 1983, p.7-19, In Russian with English summary. 9 refs.

Based on hydroacoustic data and observations at geological stations a brief structural-geomorphological analysis of the Antarctic shelf and continental slope is made. Exploration and fishing conditions of various morphological structures are discussed. The underwater Antarctic margin, with a deep cleft relief of the continental slope and some seamounts with relatively shallow peaks, are very likely to be promising fishing areas. (Auth.)

Popkov, V.V., **Position of frontal zones and distribution of krill clusters in the Pacific sector of the Antarctic** [Polozhenie frontal'nykh zon i raspredelenie skopleniĭ krilia v Tikhookeanskom sektore Antarktiki], Antarkticheskiĭ kril'. Osobennosti raspredeleniia i sreda. Edited by T.G. Liubimova, R.R. Makarov, and E.A. Kamenskaia, Moscow, Legkaia i Pishchevaia Promyshlennost', 1983, p.66-73, In Russian with English summary. 26 refs.

The position of the South Polar Front and Antarctic Divergence is reviewed on the basis of data obtained at hydrological stations in the summer (January-March) of 1970-1977. The position of the South Polar Front is outlined from peculiarities of the vertical structure of water in the 0-1000 m layer. It is fairly stable and is not subject to annual fluctuations. The Antarctic Divergence is outlined on the basis of the distribution of temperature and salinity at 23 meridional transects extending from 60 S to the Antarctic coast. It is shown that there are two zones of upwelling in the area. The first, observed only in the west part of the Pacific sector over the South Pacific Ridge, is formed by cyclonic eddies; the second, observed in the entire Pacific Antarctic in the vicinity of the Antarctic continental slope, is caused by the meridional component of the east drift.

Maslennikov, V.V., Soliankin, E.V., Spiridonov, V.A., Sysoeva, M.V., **Investigation of origin of *Euphausia superba* Dana specimens off South Georgia** [K issledovaniiu proiskhozhdeniia osobeĭ *Euphausia superba* Dana, vstrechaiushchikhsia v raĭone o-va IUzhnaia Georgiia], Antarkticheskiĭ kril'. Osobennosti raspredeleniia i sreda. Edited by T.G. Liubimova, R.R. Makarov, and E.A. Kamenskaia, Moscow, Legkaia i Pishchevaia Promyshlennost', 1983, p.74-85, In Russian with English summary. 11 refs.

The distribution patterns of various size groups of *E. superba* with regard to the water structure off South Georgia was studied in February 1975 and in May and March 1981. Charts of horizontal circulation of water are compiled on the basis of data obtained in oceanographic surveys and the corresponding distribution of various modifications of antarctic water is analyzed. The size frequency distribution of *E. superba* is considered in the same time intervals. It is shown that two pairs of krill groups occur off South Georgia and in the southern Scotia Sea which are associated with two different water masses, the Weddell Sea and The Antarctic Circumpolar Current. (Auth.)

Poluiaktov, V.F., Soliankin, E.V., Khvatskiĭ, N.V., Khomutov, A.V., **Hydrological conditions as factors responsible for krill distribution in the southern section of the Bransfield Strait** [Osobennosti gidrologicheskikh usloviĭ kak faktorov raspredeleniia krilia v iugo-vostochnoĭ chasti proliva Bransfild], Antarkticheskiĭ kril'. Osobennosti raspredeleniia i sreda. Edited by T.G. Liubimova, R.R. Makarov, and E.A. Kamenskaia, Moscow, Legkaia i Pishchevaia Promyshlennost', 1983, p.99-102, In Russian with English summary. 3 refs.

Based on observations made in the southeastern part of the Bransfield Strait, a chart of geostrophic currents is presented. The field is associated with the distribution of temperature in the surface layer and such hydrochemical characteristics as the content of silicates, phosphates and the Si/P ratio. Inflow of Weddell Sea water to the shelf of the Antarctic Peninsula was found in the surface water circulation field. The aggregations of *E. superba* encountered on the shelf of D'Urville Island were associated with a local eddy in the flow of Weddell Sea water. (Auth.)

Nagao, T., Kaminuma, K., **Heat flow measurements in Lützow-Holm Bay, Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Oct. 1983 Special issue No.28, Symposium on Antarctic Geosciences, 3rd, 1982, Proceedings, p.18-26, 16 refs.

Five heat flow measurements were made during the winter season of the 22nd Japanese Antarctic Research Expedition in the Lützow-Holm Bay, Antarctica. The apparatus used for the temperature measurements was a 1.2 m long Bullard type probe with three thermistors. Temperature gradients were determined at five different sites in shallow waters on the shore fast sea ice in November 1981. The temperature data were corrected following Bullard's method. The thermal conductivities were determined on sediment samples recovered by coring before the temperature measurements were made. Since these measurements were made in shallow water, the effects of the sea floor topography and the water temperature variation were considered. The topographic effect was computed by a two-dimensional relaxation method. Because the sea floor temperature in November is increasing, the temperature gradient of sediments has a tendency to decrease. (Auth. mod.)

Moriwaki, K., Yoshida, Y., **Submarine topography of Lützow-Holm Bay, Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Oct. 1983 Special issue No.28, Symposium on Antarctic Geosciences, 3rd, 1982, Proceedings, p.247-258, 20 refs.

The huge depression of the central part of Lützow-Holm Bay is the drowned glacial trough extending from the Shirase Glacier. This trough and another off the Telen Glacier were formed probably by glaciation along faults. The sea floor of Lützow-Holm Bay is divided into the eastern and the western parts by the central trough. The greater part of the western sea floor is 300 m deeper than the northeastern sea floor. This difference in depth was caused probably by faulting. Many drowned glacial troughs exist in the eastern part. They were eroded selectively by ice streams conformably with the strike of gneissic foliation of bedrock. Rows of circular depressions seem to have been formed also along the strike of foliation by the plucking of the ice sheet. Cross profiles of troughs indicate the possibility of occurrence of multiple glaciations. Directions of troughs are different from those of glacial striae in coastal ice-free areas, and this seems to indicate that part of lower ice in troughs flowed in the different direction from the upper part of the ice sheet. (Auth.)

SCAR/SCOR/IABO/ACMRR Group of Specialists on Southern Ocean Ecosystems and their Living Resources, **First Post-FIBEX Hydrographic Data Interpretation Workshop,** *Biological Investigations of Marine Antarctic Systems and Stocks. BIOMASS report series,* 1982 No.30, 11p., 1 ref.

Described are: events leading to the formation of this Workshop; the Oceanographic Database and Data Handling System; their introduction to the Workshop participants; the analytical procedure adopted by the Workshop; and the hydrology of the Bransfield Strait area during FIBEX. Three figures, showing water classes in the Bransfield Strait, its relative dynamic topography at the 100 dbar surface and at the 200 dbar surface during FIBEX, are presented. The following recommendations are endorsed by the participants: 1. A second Hydrography Workshop should be held as soon as possible. 2. A hydrographer should be present at all biological workshops and meetings to discuss the implications of hydrographic phenomena. 3. Further studies should be carried out in the Bransfield Strait area, where high concentrations of krill appear to be correlated with distinctive hydrographic phenomena. 4. A list of standard hydrographic stations should be adopted to establish seasonal and annual trends and to provide the necessary environmental data record for an understanding of krill distribution dynamics.

J-29192

SCAR/SCOR/IABO/ACMRR Group of Specialists on Southern Ocean Ecosystems and their Living Resources, **Second Post-FIBEX Hydrographic Data Interpretation Workshop,** *Biological Investigations of Marine Antarctic Systems and Stocks. BIOMASS report series,* 1983 No.31, 26p., 3 refs.

The geopotential topography of the Bransfield Strait is reviewed, confirming the findings of the First Workshop and adding new data. The water classes of the area are described, as is the position of the Weddell—Scotia Confluence. Hydrographic stratification and krill aggregation data are analyzed. Twenty figures, illustrating the material covered by the Workshop, are included. The following recommendations are put forward: 1. The Argentine data should be verified from original measurements before they are included in the final BIOMASS Data Base. 2. All CTD/STD/ hydrocast profiles should be extended to the near vicinity of the bottom to permit more accurate determination of geostrophic currents. 3. The extensive manipulation required of oceanographic data should be performed by only one or two oceanographers before it is reviewed and evaluated at a full workshop meeting. 4. All physical/chemical data from FIBEX cruise should be submitted to national oceanographic data centers on completed ROSCOP/ROBI forms.

J-29203

Golubev, IU.N., Lomakin, P.D., Cherkesov, L.V., **Generation of topographic vortices and their possible effect on formation of productive zones in the ocean** [Generatsiia topografychnykh vikhoriv ta ikh mozhlyvyĭ vplyv na formuvannia produktyvnykh zon v okeani], *Akademiia nauk URSR, Kiev. Dopovidi. Seriia A Fizyko-matematychni ta tekhnichni nauky,* 1983 No.2, p.25-28, In Ukrainian with English summary. 3 refs.

Increased biological productivity is found on the slope of the Ob bank, where a geostrophic current is created by the water motion of two contiguous eddies. The biogenic concentration is found to be inversely proportional to the acidity of sea water.

Whitworth, T., III, **Monitoring the transport of the Antarctic Circumpolar Current at Drake Passage,** *Journal of physical oceanography,* Nov. 1983 13(11), p.2045-2057, 18 refs.

Data from an extensive moored instrument array and three hydrographic cruises are used to calculate a time series of the net transport through the upper 2500 m of the Drake Passage. The baroclinic geostrophic transport was monitored with heavily instrumented moorings at each side of the passage. Pressure gauge measurements at the northern and southern ends of the passage provided a reference speed at 500 m to adjust the relative transport. The net transport of the upper 2500 m for the 370-day record ending in January 1980 averaged 121 million cu m/s. The total transport though the entire cross-sectional area of Drake Passage is probably between 118 and 146 million cu m/s. Fluctuations in the relative transport are related to changes in latitude of the northernmost front in the passage, the Subantarctic Front. Variability of the net transport is coherent with the zonally averaged eastward wind stress. (Auth.)

Sato, T., **5th edition of the GEBCO,** *Polar news,* Aug. 1983 No.37, p.41-44, In Japanese.

The history of the General Bathymetric Charts of the Oceans since 1899 and the international atmosphere around the start of the 5th edition of the GEBCO are reviewed. The 18 new GEBCO 1:10,000,000 sheets were completed in 1982; they include several characteristic features such as a new scheme of sheets, isobath interval of 500 m, indication of data control, adoption of bathymetric charts prepared on larger scales among others. The philosophy of bathymetric chart production is that the expertise of modern geoscience knowledge should determine the representation of isobaths. Thus the completed new GEBCO sheets reflect the concept of plate tectonics. (Auth.)

MacAyeal, D.R., **Thermohaline circulation below the Ross Ice Shelf: a consequence of tidally induced vertical mixing and basal melting,** *Journal of geophysical research,* Jan. 20, 1984 89(C1), p.597-606, 45 refs.

The warmest water below parts of the Ross Ice Shelf resides in the lowest portion of the water column because of its high salinity. Vertical mixing caused by tidal stirring can thus induce ablation by lifting the warm but dense water into contact with the ice shelf. A numerical tidal simulation indicates that vertically well-mixed conditions predominate in the southeastern part of the sub-ice-shelf cavity where the water column thickness is small. Basal melting in this region is expected to be between 0.05 and 0.5 m/yr and will drive a thermohaline circulation having the following characteristics: high salinity shelf water (at -1.8C), formed by winter sea-ice production in the open Ross Sea, flows along the seabed toward the tidal mixing fronts below the ice shelf; and meltwater (at -2.2C), produced in the well-mixed region, flows out of the sub-ice-shelf cavity along the ice shelf bottom. Sensitivity of this ablation process to climatic change is expected to be small because high salinity shelf water is constrained to have the sea-surface freezing temperature. (Auth.)

J-29228

MacAyeal, D.R., **Numerical simulations of the Ross Sea tides,** *Journal of geophysical research,* Jan. 20, 1984 89(C1), p.607-615, 49 refs.

Tidal currents below the floating Ross Ice shelf are reconstructed by using a numerical tidal model. They are predominantly diurnal, achieve maximum strength in regions near where the ice shelf runs aground, and are significantly enhanced by topographic Rossby wave propagation along the ice front. A comparison with observations of the vertical motion of the ice shelf surface indicates that the model reproduces the diurnal tidal characteristics within 20%. Similar agreement for the relatively weak semi-diurnal tides was not obtained, and this calls attention to possible errors of the open boundary forcing obtained from global-ocean tidal simulations and to possible errors in mapping zones of ice shelf grounding. Air-sea contact below the ice shelf is eliminated by the thick ice cover. The dominant sub-ice-shelf circulation may thus be tidally induced. A preliminary assessment of sub-ice-shelf conditions based on the numerical tidal simulations suggests that (1) strong barotropic circulation is driven along the ice front and (2) tidal fronts may form in the sub-ice-shelf cavity where the water column is thin and where the buoyancy input is weak. (Auth.)

Gordon, A.L., Chen, C.T.A., Metcalf, W.G., **Winter mixed layer entrainment of Weddell Deep Water,** *Journal of geophysical research,* Jan. 20, 1984 89(C1), p.637-640, 26 refs.

Observations show that the mixed layer below the sea ice just prior to the austral spring retreat in the 60 deg S Greenwich meridian region has an oxygen content of 7.4 ml/l. The source of this deficit is believed to be a consequence of oxygen-poor (4.5 ml/l) Weddell Deep Water (WDW) entrainment by the winter mixed layer. A mixing ratio of 1:3 for WDW to "beginning of winter" surface water is required to explain the end-of-winter mixed-layer oxygen content. Accompanying the WDW transfer into the mixed layer is heat transfer of approximately 7000 cal/ sq cm as well as salt transfer, which requires 34 cm of fresh water to produce typical mixed-layer salinity. A mean annual heat flux of 12 W/sq m is suggested, with an annual demand for freshwater of 46 cm/yr. The remaining freshwater is derived from excess precipitation and possibly iceberg melt. Oxygen undersaturation of the winter surface water suggests slightly less potential for abyssal water ventilation than might be expected from a fully saturated condition. (Auth. mod.)

J-29230

Gordon, A.L., Huber, B.A., **Thermohaline stratification below the southern ocean sea ice,** *Journal of geophysical research,* Jan. 20, 1984 89(C1), p.641-648, 28 refs.

The temperature maximum of the Weddell Deep Water (WDW) is, for the most part, less than 0.5C, but warmer cells of WDW are found. These warm WDW cells have temperature, salinity, and oxygen properties similar to the WDW characteristic of the Weddell gyre inflow. The warm WDW cells are accompanied by domes in the pycnocline of 40 m amplitude over the surrounding pycnocline, while deeper isopycnals are depressed. The pycnocline domes are exposed to about 50% greater entrainment by the turbulently active winter mixed layer, relative to the regional entrainment rate. This entrainment can significantly erode the warm cells in a single winter season, introducing excess heat and salt into the mixed layer. It is hypothesized that the warm WDW cells within the Weddell gyre trough are derived from instability within the frontal zone which extends from Maud Rise to the northeast, separating the Weddell warm regime from the cold regime. Greater than normal injection of warm WDW cells into the Weddell gyre trough would increase the surface salinity, which would tend to destabilize the pycnocline, increasing the probability of deep convection and polynya events. (Auth. mod.)

J-29273

Ono, N., Motoi, T., **Some characteristics of summer ocean structure off the Queen Maud Land, Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Nov. 1983 Special Issue No.29, Symposium on Polar Meteorology and Glaciology, 5th, 1982. Proceedings. Edited by K. Kusunoki, p.127-134, 5 refs.

The hydrographic data of *Fuji* obtained where the Weddell polynya appeared during the winters of 1973-1977, are examined for finding out the influence of a winter polynya on summer ocean structure. Vertical profiles of temperature, salinity and sigma-t at station 75-7 on February 26, 1975, for the JARE-16 show the absence of water below 0 C, both the weak minimum and the weak maximum temperature profile, a high-salinity water at the depth where the temperature is minimum, and a shallow pycnocline. These features, which reveal the upward movement of saline water, are different from the anomalous features at station 115 of the cruise of the *Islas Orcadas,* where sinking of the cooled surface water occurred. The same features as the profiles at stations 75-7 and 115 are found at stations 118 and 125 respectively in the *Islas Orcadas* data. These four stations were located near the margin of the polynya in the preceding winter, and both types of anomalous features reveal that strong convection, which occurred locally in the polynya area in the preceding winter, influences summer ocean structure. (Auth. mod.)

Dera, J., **Oceanographic investigation of the Ezcurra Inlet during the 2nd Antarctic Expedition of the Polish Academy of Sciences (PAS),** *Oceanologia,* 1980 No.12, p.5-27, With Polish summary.

This report is a preliminary presentation of the characteristic features of the Ezcurra Inlet on King George Island. The parameters considered are meteorological conditions, ice confluence, currents and tides, water salinity and temperature, concentration of oxygen and nutrients, suspensions and water transparency, underwater visibility, solar radiation and underwater lightfield, pigments, phytoplankton and primary production, and zooplankton and its bioluminescence.

Osborn, N.I., Ciesielski, P.F., Ledbetter, M.T., **Disconformities and paleoceanography in the southeast Indian Ocean during the past 5.4 million years,** *Geological Society of America. Bulletin,* 1983 94(11), p.1345-1358, 55 refs.

Biostratigraphy and magnetostratigraphy are used to identify deep sea disconformities in the Indian Ocean, and increased bottom-water and deep sea circulation patterns. The causes of increased bottom-water activity may be correlated with paleoclimatic events. Southern ocean cooling and the proposed re-establishment of the West Antarctic ice sheet and its fringing ice shelves in the late Gilbert Chron (4.2 to 3.6 m.y. B.P.) were accompanied by increased Antarctic Bottom Water and Circumpolar Deep Water activity as revealed by the frequency of both shallow and deep disconformities. (Auth.)

Naito, Y., **Antarctic marine ecosystems,** *Polar news,* Jan. 1983 No.36, p.6-11, In Japanese.

Some distinctive oceanographical aspects of the southern ocean, such as the unique current system which separates it from other oceans, are explained. The relation between these oceanographical peculiarities and the antarctic marine ecosystem is emphasized. This ecosystem is also discussed from the viewpoint of energy efficiency. The relative simple food web in the Antarctic Sea indicates that energy flows efficiently from the primary producer to the final consumers and shows that the biomass of the final consumers such as seals and whales which predominantly prey on krill is quite enormous. These high energy efficiencies do not ensure the high gross production in the Antarctic Sea. In discussing the production in the southern ocean, both the energy efficiency of the food web and the production rate should be taken into consideration. A recent BIOMASS study confirms these concepts although the winter season data that is essential in the evaluation of production rate is quite limited. (Auth.)

Ishino, J., **Scientific results of antarctic ocean survey (Physical oceanography),** *Polar news,* Jan. 1983 No.36, p.12-16, In Japanese.

During the past twenty-five years, there has been an enormous increase of the oceanographic knowledge concerning the antarctic circumpolar waters. This has been mainly due to an increase in research activities and to the remarkable development of instrumentation such as inductive salinometer, CTD (STD), XBT and drifting and/or moored buoy systems. Application of satellite techniques have also made it easier to fix a ship's position as well as to gather information concerning synoptic oceanographic conditions. Japanese research vessels; such as *Umitaka, Fuji* and *Kaiyo,* made many cruises during this period providing valuable contributions to the development of this scientific knowledge. Currents and circulations in the southern ocean were frequently surveyed in considerable detail. The Antarctic Divergence is not only a physical phenomenon in the southern region of these waters but also important for the occurrence of Antarctic krill and Japanese oceanographers took much interest in it. Some observations were conducted in the sea ice-covered region, and the measurements of water movement by using current meters at stations in the vicinity of Antarctica were made. (Auth. mod.)

Kuramoto, S., Koyama, K., **Preliminary report of the oceanographic observation in the 22nd Japanese Antarctic Research Expedition (1980-1981),** *National Institute of Polar Research, Tokyo. Memoirs,* Oct. 1982 Special issue No.23, Proceedings of the Fifth Symposium on Antarctic Biology, edited by T. Hoshiai and Y. Naito, p.5-12, 5 refs.

This report presents the preliminary results of the oceanographic observations, which were carried out in the 22nd Japanese Antarctic Research Expedition in 1980-1981. The oceanographic sections across the Antarctic are given for the two legs, southbound and northbound. For the southbound leg, observations of the surface layer are given. For the northbound leg, the results of serial observations are presented along with the analysis of the geostrophic volume transports. The results of continuous measurements at two fixed stations near Showa Station are also given. (Auth.)

Zotikov, I.A., Zagorodnov, V.S., **Thermal conditions of the Ross Sea under the Ross Ice Shelf** [Teplovoĭ rezhim moria Rossa pod shel'fovym lednikom Rossa], *Antarktika; doklady komissii,* 1980 No.19, p.167-172, In Russian. 4 refs.

Temperatures of water masses under the Ross Ice Shelf, measured by a highly sensitive quartz thermometer, are reported. The data show two nonuniform, isothermal water layers. Subglacial currents were located and their speed was measured. Thermal fluxes, regulating the thawing and freezing processes under the lower surface of the shelf, are studied. Plans for future studies in the same area, using underwater soundings, are outlined.

Rama Raju, D.V., Somayajulu, Y.K., **Some physical characteristics of the Antarctic and western Indian Oceans,** Indian Expedition to Antarctica, 1st. Scientific report, New Delhi, Department of Ocean Development, 1983, p.53-61, 6 refs.

Expendable bathythermograph (XBT) and hydrographic observations made along the transects through Antarctic and western Indian Oceans on board M.V. *Polar Circle* during the First Indian Expedition have been analyzed and are presented in this paper. A wide north-south variation in the physical oceanographic parameters has been noticed along the transects. Maximum sea surface temperatures have been observed between latitudes 6-10 S and a sharp fall of temperature has been found near the convergence zones particularly between latitudes 40-50 S. The surface temperatures ranged between 28.7 C and -1.7 C. The depths of the isothermal (mixed) layer in the antarctic waters to the south of latitude 68 S extend to 200-400 m while at other regions they are found to be within 100 m. The data clearly shows that a convergence process is taking place around 60 S with the antarctic surface water slipping below and mixing with the subantarctic surface water. T-S analysis shows characteristic changes in T-S relations of antarctic intermediate water as the distance from the Antarctic Convergence increases. (Auth.)

Sen Gupta, R., Qasim, S.Z., **Chemical oceanographic studies along a section from 32 S to Antarctica in the southwestern Indian Ocean,** Indian Expedition to Antarctica, 1st. Scientific report, New Delhi, Department of Ocean Development, 1983, p.69-77, 18 refs.

Water samples collected during the First Indian Expedition to Antarctica, were analyzed for salinity, dissolved oxygen, pH, phosphate-phosphorus, nitrate-nitrogen, nitrite-nitrogen and silicate-silicon. These parameters were used to identify the regions of Polar Divergence, Antarctic Convergence and sub-tropical convergence. Downward gliding of the nutrient-rich water along the continental slope of Antarctica was also recorded. The atomic ratios of the change in Apparent Oxygen Utilization:Si:N:P were 285:58:19:1. A comparison of these with similar ratios from the northern Indian Ocean indicates an excess of 19% nitrate and 45% silicate in the southern Indian Ocean while the phosphate concentrations in both these seas were found to be quite similar. "Reserved" fractions of phosphate and nitrate decreased significantly from the antarctic to the subantarctic waters. This indicates that there is an increase in the intensity of oxidation process in these areas. Applying an empirical relationship between the silicate and AOU, it was observed that the lower ranges of silicate concentration were due to its consumption by siliceous algae, north of the polar divergence. Negative values between the observed and the calculated values suggest a transfer of oxygen from deeper layers to intermediate layers. (Auth. mod.)

De Souza, F.P., Sen Gupta, R., **On Fluoride, bromide and iodide in the southwestern Indian Ocean sector of the southern ocean,** Indian Expedition to Antarctica, 1st. Scientific report, New Delhi, Department of Ocean Development, 1983, p.78-86, 30 refs.

Seawater average fluoride concentration and fluoride/chlorinity ratio were measured. Samples of water up to a depth of 4000 m, when analyzed for fluoride, gave no indication of high concentrations and the effect of dissolution at or from the bottom was ruled out. Bromide content (average 68.08 mg/l) and chlorinity varied in a parallel manner and a rather constant Br/Cl ratio of 0.00347 was established. The iodide concentrations varied with depth, being greater in the upper and bottom layers at all stations. While fluoride and bromide mainly influenced the physical properties of seawater, the importance of iodide lay in the chemical and biological fields. (Auth.)

Naik, S., Noronha, R.J., Shirodkar, P.V., Sen Gupta, R., **Distribution of calcium, magnesium, sulphate and boron in the southwestern Indian Ocean region of the southern ocean,** Indian Expedition to Antarctica, 1st. Scientific report, New Delhi, Department of Ocean Development, 1983, p.87-94, 20 refs.

Calcium showed distinct variations at sub-tropical convergence and Antarctic Divergence whereas magnesium, though a conservative element, did not show any regular pattern of variation. Sulphate, a biologically inactive anion, was found to be most conservative. Boron shows dissimilar pattern of variation in the Antarctic and subtropical region and varies inversely with chlorinity in the sub-tropical region. The depth variations of all these four ions are described. (Auth.)

Sanzgiry, S., Mesquita, A., Sen Gupta, R., **Distribution of a few trace metals in a section of southwestern Indian Ocean,** Indian Expedition to Antarctica, 1st. Scientific report, New Delhi, Department of Ocean Development, 1983, p.95-99, 9 refs.

Determination of Cu, Cd, Fe, Mn, Zn, Pb, Co and Ni was carried out at different depths at 8 stations—one station being in an antarctic polynya and 7 in the southern ocean. The depth and surface variations are discussed for different parts of sampling regions—antarctic polynya, Antarctic Divergence, Antarctic Convergence and subtropical convergence. Average dissolved Cu and Cd in the 100-500 m depth layer in the Antarctic region is nearly the same as the average concentrations of the two metals in the sub-tropical surface water. In general, dissolved Fe shows enrichment towards the bottom except in the Antarctic Divergence region. Particulate Fe is high in the Antarctic region. Mn concentration is almost similar in the 100-500 m layer throughout the sampling regions. Dissolved as well as particulate Zn is higher at surface and lower in the bottom layer. Pb, Co and Ni have no definite trend of variation in either dissolved or particulate forms. (Auth.)

Siddiquie, H.N., Pathak, M.C., **Bathymetry and geomorphology of the approaches to *Dakshin Gangotri*, Princess Astrid coast, Queen Maud Land, Antarctica,** Indian Expedition to Antarctica, 1st. Scientific report, New Delhi, Department of Ocean Development, 1983, p.149-151, 3 refs.

The continental margin depths along the Princess Astrid Coast ranged from about 740 m at the northern edge of the ice pack (January 1982) to 224 m at the ice shelf. The route was found to be safe for navigation except for the presence of seasonal ice cover and large semi-permanent icebergs. The topography in the area is marked by a sill at about 120 m depth which separates the deeper open ocean (> 700 m) in the north and more than 200 to 700 m in the south. The position of the sill is marked by the grounding of numerous icebergs. The sill perhaps plays a significant role in the separation of water masses of the area and even in the development of polynya. (Auth.)

Ponomarev, V.I., **Nonlinear diagnostic model of the mesoscale circulation in the zone of water confluence of Scotia and Weddell Seas** [Nelineĭnaia diagnosticheskaia model' mezomasshtabnoĭ tsirkuliatsii v zone sliianiia vod moreĭ Skosha i Ueddella], *Meteorologiia i gidrologiia,* 1983 No.11, p.68-75, In Russian with English summary. 10 refs.

A nonlinear diagnostic model of mesoscale oceanic circulation is considered. With the aid of this model, three components of current velocity in the zone of water confluence of Scotia and Weddell Seas are calculated. Peculiarities in the vertical water circulation in the frontal zone region and in mesoscale vortices are revealed. The degree and nature of the influence of nonlinear inertial forces on the baroclinic and barotropic components of horizontal velocity as well as on the vertical speed are determined. (Auth.)

Heath, R.A., **Tidal currents in the southwestern Pacific Basin and Campbell Plateau, southeast of New Zealand,** *Deep-sea research,* Apr. 1983 30(4A), p.393-409, 13 refs.

Tidal analyses of 7 months of hourly current meter records from nine current meters and 18 months of similar records at three depths, near 49.5S, 170 W, 650 km east of the Subantarctic Slope are reported. The M2 barotropic tide has a small positive ellipticity and is consistent with a Kelvin wave progressing anticlockwise around New Zealand. There is a distinct vertical structure in the M2 ellipticity that decreases with depth and becomes negative below about 2200 m. The distinct vertical structure results from superposition on the barotropic ellipse of a baroclinic ellipse which must be approximately perpendicular to the Subantarctic Slope. The S2 tidal ellipse has minimal vertical structure and is consistent with a free wave; the distinction between the S2 and M2 tides agrees with previous analyses based on tidal observations. Analysis of 7 months of hourly current meter records from the Campbell Plateau west of the top of the Subantarctic Slope indicates strong diurnal tidal currents with the relative K1/M2 admittance of the currents increasing by a factor of 10 from the southwestern Pacific Basin to the Subantarctic Slope. The strong diurnal currents are taken as evidence for the presence of an internal continental shelf wave on the Subantarctic Slope. (Auth. mod.)

Ledbetter, M.T., Ciesielski, P.F., Osborn, N.I., Allison, E.T., **Bottom-current erosion in the southeast Indian and southwest Pacific Oceans during the last 5.4 million years,** Antarctic earth science; fourth international symposium. Edited by R.L. Oliver, P.R. James and J.B. Jago, Cambridge University Press, 1983, p.379-383, 20 refs.

DLC QE350.A57 1983

Hiatus frequency in the sedimentary record in the southeast Indian Ocean during the last 5.4 Ma defines periods of increased velocity of Antarctic Bottom Water and Circumpolar Deep Water. Increases in the extent of erosion by Circumpolar Deep Water occurred in the late Gauss Chron and late Matuyama Chron. Increased Antarctic Bottom Water erosion occurred in the late Gilbert Chron with a small increase in the late Matuyama Chron. The upper Matuyama disconformity is much greater in extent than at present in both deep and shallow areas. Bottom-current erosion has waned extensively since the late Matuyama. The percent manganese micronodules increases dramatically between 3.0-4.5 Ma and at 1.2-1.3 Ma indicating a reduction in sedimentation rate associated with increased bottom-current velocity. Similarly the silt mean particle-size coarsens at the same times indicating a coarse lag deposit under high velocity currents. The periods of increased Antarctic Bottom Water velocity correspond to episodes of Antarctic cooling and expansion of ice-sheets/shelves. The sharp decrease in velocity at 3.0-3.2 Ma occurs in response to the decrease in North Atlantic Deep Water production as a result of the freezing over of the Norwegian Sea during the Northern Hemisphere Ice Ages. The widespread shallow and deep disconformities at 2.0-1.5 Ma are in response to cooling of the Ross and Weddell Seas and the steepening of the latitudinal temperature gradient. (Auth. mod.)

Ledbetter, M.T., Ciesielski, P.F., **Bottom-current erosion in the South Atlantic sector of the southern ocean,** Antarctic earth science; fourth international symposium. Edited by R.L. Oliver, P.R. James and J.B. Jago, Cambridge University Press, 1983, p.390-392, 23 refs.

DLC QE350.A57 1983

The magnetostratigraphy and biostratigraphy of 61 piston cores on two traverses from Antarctica to the Agulhas Basin south of Africa reveal disconformities in the sedimentary record which are attributed to bottom-current erosion. Increased Antarctic Bottom Water production removed most sediment at the eastern end of the Weddell Basin younger than Middle Pliocene (2.5 Ma) with Miocene or older sediment exposed at or near the seafloor at some locations. Increases in the velocity of the Circumpolar Deep Water eroded Pliocene sediment on the crest and south flank of the Southwest Indian Ridge and maintains an active scour zone today with Middle Pleistocene (1.0 Ma) sediment exposed at the seafloor. (Auth.)

Elverhöi, A., Maisey, G., **Glacial erosion and morphology of the eastern and southeastern Weddell Sea shelf,** Antarctic earth science; fourth international symposium. Edited by R.L. Oliver, P.R. James and J.B. Jago, Cambridge University Press, 1983, p.483-487, 20 refs.

DLC QE350.A57 1983

Sampling (38 samples) of the surface sediments in the eastern and southeastern Weddell Sea show till intermittently overlain by glaciomarine deposits, supporting the concept of Late Wisconsin grounded ice extending to the shelf edge. The 1100 m deep Crary Trough has been covered by grounded ice, indicating increased ice discharge from the Filchner Ice Shelf. Sparker data show former grounding over the entire shelf and (1) a thin (< 15 m) veneer of sediments above a well defined angular unconformity in most places, and (2) accumulations (100-400 m (two-way travel time) thick) of glaciogenic deposits in the mouth of the Crary Trough, which consist of two units, separated by an angular unconformity. The upper unit, confined to the eastern side of the Crary Trough, is unconformable with the sea floor in its western and southern part. Tentative dating of the strata unconformably underlying the glaciogenic deposits in the outermost part of the Crary Trough, indicates that grounded ice had extended to the shelf edge by the Mid/Late Tertiary period. This contrasts with the Ross Sea area where glaciers were calving at the head of the embayment. (Auth.)

Kaminuma, K., Nagao, T., **Heat flow measurements in Lützow-Holm Bay, Antarctica—a preliminary study,** Antarctic earth science; fourth international symposium. Edited by R.L. Oliver, P.R. James and J.B. Jago, Cambridge University Press, 1983, p.515-518, 7 refs.

DLC QE350.A57 1983

A new technique for measuring temperature gradients on the ocean bottom under the sea ice has been developed, and has been used to measure temperatures at five observation points during the wintering in Lützow-Holm Bay in 1981. The apparatus, used for these measurements, consists of a probe, a connection receptacle, and a pressure vessel. The data from three thermistors in the probe were recorded in IC memories with three channels. The total number of samplings at each channel is 256, at either 30 second or 60 second intervals. The system accuracy of the measurement is 0.01 C, and the resolution is 0.001 C. The depths of the sea water at the measurement points are between 500 and 800 m, and the thickness of the sea ice is approximately 1.5 m. Before each measurement, a core of the sediment layer in the sea bottom was collected by a gravity corer. The thermal conductivity of the sediment was obtained from the core. The sea water temperatures at the sea bottom range from -1.30 C to -0.08 C, and those at the top layer of the sediment from -1.24 C to -0.05 C. The heat flows at the individual stations range from 0.86 to 5.43 HFU (1 HFU=0.000001 cal/sq cm/s). The high heat flow is an unexpected result in the marginal area of the East Antarctic Shield. (Auth.)

Sarukhanian, E.N., Smirnov, N.P., **Current status and problems of southern ocean studies** [Sovremennoe sostoianie i problemy izucheniia IUzhnogo okeana], 25 let Sovetskoĭ antarkticheskoĭ ekspeditsii. (25 years of Soviet antarctic expeditions). Edited by E.S. Korotkevich and L.I. Dubrovin, Leningrad, Gidrometeoizdat, 1983, p.52-65, In Russian. 19 refs.

Results of experimental studies of the southern ocean, carried out recently by the POLEX-South and ISOS programs, are presented. Circulation systems to the north and south of the Antarctic Circumpolar Current and their role in its water mass and energy balance are discussed, as are the Current's characteristics and variability, its direction and vorticity and deep-water formation and how they affect global circulation. The problems of interaction between the antarctic ocean and the air above it are also pointed out.

Wegner, G., **Two temperature sections through the southern Atlantic and southeastern Weddell Sea,** *Deutsche wissenschaftliche Kommission für Meeresforschung, Berlin. Berichte,* 1982 29(4), p.239-243, In English with German summary. 6 refs.

Two temperature sections, which were made predominantly with XBT from M.V. *Polarsirkel* on the cruise toward the Filchner Ice Shelf and Atka Ice Port, 1980/81, show the characteristic thermal structure of the water masses crossed—even off the Antarctic continental ice front. The frontal areas are stressed by crowded isotherms. In the area of the Scotia Ridge and the South Sandwich Islands the isotherm courses indicate eddy or meander formation, owing to the topography. (Auth.)

J-29666

Pommeranz, T., Herrmann, C., Kühn, A., **Mouth angles of the rectangular midwater trawl (RMT1+8) during paying out and hauling,** *Deutsche wissenschaftliche Kommission für Meeresforschung, Berlin. Berichte,* 1982 29(4), p.267-274, In English with German summary. 8 refs.

About 900 tows have been made by standard RMT1+8 during 3 expeditions to Antarctic waters. In order to relate the resulting catches to volumes of water filtered it was essential to know the dependences of mouth angles on the speed of the nets through the water (V). These are known from the literature for horizontal but not for oblique towing. As, however, most of the present tows were purely oblique or had oblique phases, mouth angles to the vertical (theta) of a standard RMT1+8 were measured at different V during paying out and hauling. These theta-values were corrected for the corresponding angles of the tow path in order to obtain angles theta sub f, which determine the size of the effective mouth areas. For describing the dependences of theta sub f on V a polygon was fitted to the obtained theta sub f-values of the RMT1 and a compound curve type known from the literature for horizontal towing to the data of the RMT8. It is suggested to apply these curves correspondingly separate to horizontal and oblique tow phases. In contrast to indication from the literature the RMT1+8 was always stable during the present study and can be considered to allow reliable estimates of volumes filtered. (Auth.)

Informatsionnyĭ biulleten',* 1983 Vol.103, p.54-60, In Russian. 6 refs.

Tabulated results of investigations carried out from July to Dec. 1976 in the Molodezhnaya Station area, show small variability of amplitude and angle of the eight principal winter tidal waves. In the winter period, July to November, the maximum range of overall sea level fluctuation amounted to 150 cm, while the difference between extreme average daily levels was 56 cm.

J-29798

Le Corre, P., Minas, H.J., **Distribution and variation of nutrients in the Indian sector of the Antarctic Ocean during late summer** [Distribution et évolution des éléments nutritifs dans le secteur indien de l'Océan Antarctique en fin de période estivale], *Oceanologica acta,* Oct. 1983 6(4), p.365-381, In French with English summary. 71 refs.

Nutrient distribution (nitrate, silicate, phosphate) was obtained from a north-south transect made up of 28 stations between 40 S and 62 S, west of the Kerguelen Islands, where data on hydrography and phytoplankton growth were also collected. Different areas in the southern ocean are clearly distinguished by nutrient data, especially N/P and N/Si ratios. In the Antarctic surface waters, very high nutrient levels are generally found; thus any limitation of phytoplankton production by these elements may be ruled out. Which factor accounts for the lack of sustained algal production in these potentially rich waters is still a matter of debate. Regeneration assessment in the Antarctic intermediate water leads to the conclusion that mixing occurs between three water bodies: thermal minimum water, central water and the deep water characterized by a minimum oxygen content. A multivariate analysis performed on oxygen, salinity and nutrient data, together with a regeneration assessment, shows that the low level of oxygen results from advective phenomena rather than from a local origin. A well-marked silicate increase is found in the Antarctic bottom water and ascribed to regeneration from sediments. An increase of nitrogen is also found; however, the source of this increase remains unclear. (Auth. mod.)

Taylor, H.W., **Some large scale aspects of the southern ocean and its environment,** New York, Columbia University, 1980, 164p., University Microfilms order No.81-05106, Ph.D. thesis. Refs. p.130-138.

The wind stress upon the sea surface at 5 x 5 deg latitude and longitude grid points is presented for the first time over the entire southern ocean. The dependent parameters of Ekman Transport, wind stress curl, upwelling velocity at the base of the Ekman layer, and Sverdrup Transport are also presented, derived here using spherical coordinates due to the high latitudes involved. The distribution of the resulting quantities is discussed and compared to many similar geographical trends of the oceanographic data. The question of cause and effect, in particular reference to the oceanic polar front, is presented. The Ekman Transport and resulting upwelling values are then put to use, in conjunction with heat budget data from other investigators, in an effort to explain the high gradients of the polar front by the local sea-air flux of heat and momentum. The expected gradients are opposite to those observed. The high gradients of the polar front zone are then a cause of the observed heat budget in that vicinity, rather than a result, and the conclusion is drawn that the surface ocean is forced on a larger scale in connection with the deep ocean, and the Antarctic Circumpolar Current (ACC). The observed coupling of the ocean bottom bathymetry with the path of the ACC and associated parameters is investigated, as is a box model for Antarctic Surface Water in which upwelling Circumpolar Deep Water and sea-air-continent fresh water sources balance the sinks of Antarctic Bottom Water and surface and near-surface polar front discharge. Chen, C.T.A., **Carbonate chemistry of the Weddell Sea,** *U.S. Department of Energy. Report,* Mar. 1984 DOE/EV10611-4, 118p., Refs. p.99-106.

Concurrent pH, calcium and total alkalinity data were obtained in the eastern Weddell Sea in the late austral Winter of 1981 as part of the US-USSR Weddell Polynya Expedition aboard the Soviet icebreaker *Somov.* These data represent the initial concentrations of calcium, alkalinity and total CO2 in the most important source region of world ocean bottom waters at the time they were formed. For the first time we can evaluate the variation of calcium and carbon cycles in the deep oceans referenced to the source water. Our Weddell Sea data were analyzed with data reported in the literature, and the results indicate that: the October pH values south of the Polar Front are indistinguishable from the November values, but the seasonal effect is large north of the front; a large change in pH occurs at the ice edge; partial CO2 pressure in the Weddell Sea surface water is only slightly lower than the atmospheric value; the alkalinity does not show cross-ice-edge or seasonal variations, but the values seem to increase at a slower rate with decreasing temperature south of the Polar Front; sea ice is relatively high in calcium and alkalinity concentrations; mixing dominates the distribution of chemical properties; pH is useful in identifying the sources of waters in the Weddell Sea, whereas calcium and alkalinity are not. Talley, L.D., **Meridional heat transport in the Pacific Ocean,** *Journal of physical oceanography,* Feb. 1984 14(2), p.231-241, Refs. p.240-241.

The heat transported meridionally in the Pacific Ocean is calculated from the surface heat budgets of Clark and Weare and others; both budgets were based on Bunker's method with different radiation formulas. The meridional heat transport is also calculated from the surface heat budget of Esbensen and Kushnir, who used Budyko's method. The heat transport is southward at most latitudes if the numbers of Clark and of Weare are used. It is northward in the North Pacific and southward in the South Pacific if Esbensen and Kushnir's numbers are used. Systematic errors in both calculations appear to be so large that confident determination of even the sign of the heat transport in the North Pacific is not possible. The amount of heat transported poleward by all oceans is obtained from the Pacific Ocean calculation and transports in the Atlantic and Indian Oceans based on Bunker's surface heat fluxes. (Auth.)

Bubnov, V.A., Burkov, V.A., Grachev, IU.M., Koshliakov, M.N., **Quasi-stationary cyclonic eddy in the Antarctic Circumpolar Current south of Africa** [Kvazistatsionarnyĭ tsiklonicheskiĭ vikhr' v Antarkticheskom tsirkumpoliarnom techenii k iugu ot Afriki], *Akademiia nauk SSSR. Doklady,* 1984 275(3), p.737-740, In Russian. 4 refs.

Eddy velocity measurements, carried out between latitudes 40 and 52 S, showed the following values: 45 to 55 cm/s at 300 m depth, and 35 to 45 cm/s at 1700 m, for the southern half of the eddy; 65 cm/s at 300 m and 45 cm/s at 1700 m, for the northern half. It is concluded that ocean eddies similar to the one described, as well as transient ones, are largely responsible for the meridional heat exchange across the antarctic front indispensable for the compensation of the yearly loss of heat, from the ocean into the air above it, in regions adjoining the Antarctic.

Miller, D.G.M., **Hydrology of water close to Gough Island,** *South African journal of antarctic research,* 1982 Vol.12, p.23-33, With Afrikaans summary. 32 refs.

Water samples were collected from 32 stations close to Gough Island. Temperature and salinity values indicate that the waters sampled were essentially sub-antarctic in character. Distribution of the major elements of the water column were relatively uniform both horizontally and vertically. This would suggest that considerable mixing of surface waters was taking place probably as a result of prevailing weather conditions in the region. Chlorophyll *a*, phosphate, nitrate, and silicate ranges were low but still directly comparable with available data for the area. However, indications are that water properties may be influenced both by variations in the position of the subtropical convergence and by possible topographical effects of the island itself. (Auth.)

Tanabe, S., Tatsukawa, R., **Vertical transport and residence time of chlorinated hydrocarbons in the open ocean water column,** *Oceanographical Society of Japan. Journal,* Apr. 1983 39(2), p.53-62, 22 refs.

The vertical transport of PCBs and chlorinated hydrocarbon pesticides such as DDT compounds and HCH (BHC) isomers in the deep sea are discussed on the basis of their vertical profiles and the proportion of their adsorbed and dissolved fractions in surface water surveyed in the western Pacific, eastern Indian and antarctic oceans. The percentages of chlorinated hydrocarbons adsorbed on suspended solids in surface water increased towards the high latitude locations, and the percentage seemed to be proportional to the concentration of suspended solids in the surface water. This implies that the residence time of chlorinated hydrocarbons in the water column will differ significantly among oceans that differ in primary productivity. The shortest value, only 11 to 19 days, was estimated for DDE+DDT in the antarctic ocean. (Auth.)

Ivanov, IU.A., Krasnopevtsev, A.IU., Morozov, E.G., Shadrin, I.F., Shcherbinin, A.D., **Evolution of cyclonic rings in the Antarctic** [Osobennosti evoliutsii tsiklonicheskogo ringa v Antarktike], *Akademiia nauk SSSR. Doklady,* 1984 275(4), p.1012-1015, In Russian. 4 refs.

Surface and bathymetric measurements, hydrochemical determinations and biological investigations are discussed in this report of a study of cyclonic ring evolution in the Antarctic. Temperature profiles show two cyclonic positions, and the eddy is described as the carrier of entrapped cold water. The incline of isothermal surfaces shows values of 0.04 at the cyclone's edge; the lowest degree of salinity is found in the eddy's center, less than 34.0 per mill, increasing toward the edges to 34.4 per mill. The T,S curves for the cyclone and the surrounding waters are significantly different. An intensification of the cold rings during their displacement northward was observed and is reported here for the first time. This effect produces significant inhomogeneities in the distribution of fields of currents, temperature, salinity, etc., far in excess of climatological values. This lends a leading role to frontal eddies in the meriodional exchange of the various parameters in the interfrontal zone of the southern ocean.

Lappo, S.S., **Energetically active regions of the World Ocean** [Energoaktivnye oblasti Mirovogo okeana], *Akademiia nauk SSSR. Doklady,* 2984 275(4), p.1018-1021, In Russian. 11 refs.

Annual variations are described and tabulated of the oceans' water temperatures and of the corresponding air temperatures. The charts include waters surrounding Antarctica.

J-30192

Morinaga, T., **Distribution of temperature, salinity and turbidity in the antarctic ocean,** *La mer,* Aug. 1983 21(3), p.123-132, In Japanese with English summary. 13 refs.

Observations of turbidity (beam transmission) were carried out simultaneously with those of temperature and salinity in the upper layer of the antarctic ocean. The beam attenuation coefficient of the subantarctic surface water was 0.24-0.26/m which is approximately twice that of the Kuroshio, while in the antarctic surface water (summer water) it was 0.10-0.22/m. In the upper layers of 0-50 m, particles smaller than 2.0 micron in size were abundant in the water near the Antarctic Convergence zone, while in the water near the Antarctic Divergence zone particles larger than 8.0 micron were abundant. The concentration of suspended matter was 0.20-0.30 mg/l in the former and 0.40-0.50 mg/l in the latter. High turbidity layers were observed near the thermocline in the area north of 60 deg S and near the halocline in the southern area. (Auth.)

Margolis, S.V., Kroopnick, P.M., Showers, W.J., **Paleoceanography: the history of the ocean's changing environments,** Environment of the deep sea. Rubey Volume 2. Edited by W.G. Ernst and J.G. Morin, Englewood Cliffs, Prentice-Hall, 1982, p.18-54, Refs. p.49-54.

DLC QH541.5.S3E58

The evolution of the present oceanographic and climatic regime appears to be controlled by a number of factors including the degree of buildup of polar ice, especially in the Antarctic; plate tectonics and sea-floor spreading; and extraterrestrial events during certain critical periods. This chapter discusses the significant paleoceanographic changes that occurred at the Cretaceous/Tertiary boundary, Eocene/Oligocene boundary, the early-middle Miocene, and the late Miocene. Each is associated with major changes in world climate and the oceanic and terrestrial biosphere. This chapter shows how an understanding of paleoceanographic trends will help identify changes occurring in the present-day oceans that will affect sea level, world climatic patterns, biogeographic distributions and ultimately humanity's future. (Auth.)

Park, P.K., Kester, D.R., Duedall, I.W., Ketchum, B.H., **Radioactive wastes and the ocean: an overview,** Wastes in the ocean, Vol.3. Radioactive wastes and the ocean. Edited by P.K. Park, D.R. Kester, I.W. Duedall, and B.H. Ketchum, New York, John Wiley & Sons, 1983, p.3-46, Refs. p.42-46.

Sources of radioactive wastes and ionizing radiation effects are reviewed, as are the radioactive substances in the ocean. Latitudinal (80 N to 80 S) distribution of Sr-90 fallout during 1958-1967 and the H-3 intrusion into deep Atlantic water from 70 N to 70 S are shown. In a table showing hydrogen bomb generated H-3 distribution in major oceans in 1972, the value for the Antarctic is 800 quadrillion Bq. Strategy for waste disposal is discussed.

Duplessy, J.C., **C-13 record of benthic foraminifera in the last interglacial ocean: implications for the carbon cycle in the global deep water circulation,** *Quaternary research,* March 1984 21(2), p.225-243, Refs. p.241-243.

The C-13/C-12 ratios of Upper Holocene benthic foraminiferal tests of deep sea cores from the various world ocean basins are compared with those of the modern total carbon dioxide measured during the GEOSECS program. Results reflect a depletion of the global organic carbon reservoir compared to the present value. Regional differences in C-13 variations between the various oceanic basins are explained by a pattern of deep water circulation different from the modern one: the Antarctic Bottom Water production during the last interglaciation was higher than today, but the eastward transport in the Circumpolar Deep Water was lower. (Auth. mod.)

Howard, W.R., Prell, W.L., **Comparison of radiolarian and foraminiferal paleoecology in the southern Indian Ocean: new evidence for the interhemispheric timing of climatic change,** *Quaternary research,* March 1984 21(2), p.244-263, Refs. p.261-263.

The deglacial transition between oxygen-isotope Stages 6 and 5e is marked by both oxygen isotopic depletion and estimated sea-surface temperature increase in two subantarctic Indian Ocean cores. Comparison of core-top assemblages with surface and subsurface conditions reveals that a three-part foraminiferal zonation reflects the surface hydrographic regime, with abrupt faunal transitions at the Subtropical Convergence (STC) and the Antarctic Polar Front (APF); and a two-part radiolarian zonation coincides with a two-part subsurface hydrographic regime, with an abrupt faunal transition corresponding to the southern terminus of subtropical lower water between the STC and the APF. It is suggested that shifts of these surface and subsurface regimes are recorded by these foraminiferal and radiolarian assemblages. Schematic maps of water-mass boundaries and dominance areas of radiolarian and foraminiferal assemblages between 20 and 60 S and 20 and 150 E are shown. (Auth. mod.)

J-30307

Inoue, M., **Vertical structure of the low-frequency currents at Drake Passage,** College Station, Texas A&M University, 1982, 220p., University Microfilms order No. 82-26097, Ph.D. thesis. Refs. p.210-219.

Recently collected hydrographic data show that each of the four water mass zones previously identified in Drake Passage is characterized by a distinctly different vertical profile of Brunt-Vaisala frequency. Stratification in Drake Passage is rather weak, and the first baroclinic radius of deformation varies from 17.3 km for the subantarctic zone in the north to 7.7 km for the continental zone in the south. The effects of various stratification profiles on oceanic response to atmospheric forcing and on baroclinic instability were considered. The oceanic response to a simple atmospheric forcing function, the length scales of which are of the order of more than 100 km, is dominated by the barotropic mode. For the stratification profiles and mean currents characteristic of Drake Passage, the zonal wave length of the fastest growing wave varies from 180 km in the subantarctic zone to 91 km in the continental zone, consistent with observed eddy scales. Barotropic and first baroclinic modes dominate the fastest growing waves, explaining the observed dominance of the two modes and the modal coupling. (Auth.)

Fu, L.-L., Chelton, D.B., **Temporal variability of the Antarctic Circumpolar Current observed from satellite altimetry,** *Science,* Oct. 19, 1984 226(4672), p.343-345, 13 refs.

Sea level measurements by the Seasat altimeter were used to study the temporal variability of the Antarctic Circumpolar Current between July and October 1978. Large-scale zonal coherence in the cross-stream sea level difference was observed, indicating a general increase in the surface geostrophic velocity of the current around the Southern Ocean. The result demonstrates the power of satellite altimetry to monitor the variability of large-scale ocean currents. (Auth.)

Biggs, D.C., Bidigare, R.R., **Oceanographic studies of epipelagic ammonium dynamics in the Scotia Sea, *Islas Orcadas* Cruises 17 and 19,** College Station, Texas A & M University, 1981, 41p. + appends., 27 refs.

This research was directed at estimating the biogenic turnover rate of NH4+ in surface waters of the Scotia Sea. NH4+ is a preferred nitrogen source for phytoplankton growth and the principal nitrogenous waste excreted by zooplankton and micronekton. Zooplankton excretion provides a significant percentage of the total daily nitrogen requirements of phytoplankton in tropical and subtropical oligotrophic open-ocean regions, and in some coastal and upwelling regions as well, but little is known of its relative importance for phytoplankton production in the Southern Ocean. Field programs were carried out on cruises 17 and 19 of ARA Islas Orcadas in austral late winter-early spring and in austral summer of 1978-1979. Both cruises focused on measuring zooplankton NH4+ excretion and water column NH4+ concentrations. In addition, uptake of N-15H4+ and N-15O3- was investigated on cruise 19. Results of the measurements are reported. (Auth. mod.)

MacDonald, S.E., **Sedimentologic and paleoceanographic implications of terrigenous deposits on the Maurice Ewing Bank, southwest Atlantic sector,** Houston, Texas, Rice University, 1984, 207p., M.A. thesis. Refs. p.181-192.

Grain size distributions of sediment samples are utilized to identify styles of sediment transport and current velocities at the benthic boundary layer. These data, along with physical oceanographic information, allow for examination of the relationship between sedimentation on the bank and circumpolar currents. Causal relationships between glacial episodes, current intensification, and bottom current scour were previously postulated. Results indicate that modern sediment distribution is controlled by both bottom and surface currents, and is modified by mass-flow processes. Indirect determinations of current velocities, using a curve relating sediment transport to current velocity, suggest a uniform energy regime of 8-12 cm/sec over the bank. These moderate velocities are supported by geostrophic velocity profiles. Current velocities assigned to down-core samples indicate no major fluctuations in circumpolar current intensity since Plio-Pleistocene time. Similar results were obtained from examination of Argentine Basin cores. (Auth. mod.)

Sandwell, D.T., **Detailed view of the South Pacific geoid from satellite altimetry,** *Journal of geophysical research,* Feb. 10, 1984 89(B2), p.1089-1104, 56 refs.

Images of sea surface undulations in the South Pacific have been constructed from GEOS 3 and SEASAT altimeter data. Height discrepancies at crossover points, associated with long-wavelength radial orbit error, were suppressed by taking along-track derivatives of the ascending and descending profiles. These geoid slopes were then rotated and scaled to produce the north and east components of the deflection of the vertical. Finally, the results are displayed by using the hill shading technique, where gray-tone images represent the inner product of the deflection vector with an assigned sun vector. Less apparent sea surface undulations can be enhanced by varying the sun's zenith and azimuth. Shorter-wavelength sea surface undulations reflect seafloor topography. Fracture zones (FZ's) appear as elongated sharp steps in the sea surface, while seamounts produce circular bumps. Data from antarctic and subantarctic areas are included in the anlysis. (Auth. mod.)

DeMaster, D.J., Nittrouer, C.A., Hoffman, P.A., **Biogenic silica accumulation on the antarctic continental shelf,** *Antarctic journal of the United States,* 1983 18(5), p.132-134, 3 refs.

During January and February 1983, 35 box cores were collected aboard the icebreaker *Glacier* from the Antarctic continental shelf. The cores were obtained between McMurdo Station and Franklin Island as well as along the Ross Ice Shelf eastward to Sulzberger Bay. Biogenic silica, which was measured using an alkaline leach, varied from 2% (by weight) in Sulzberger Bay to 35% near Franklin and Ross Islands. The siliceous ooze deposits in this area suggest that Antarctic shelf sediments may be a significant site for silica removal in the marine environment. Sediment accumulation rates in this area are being determined using Pb-210 geochronology.

Pillsbury, R.D., Lewis, E.L., Jacobs, S.S., **Ross Sea heat flux experiment field activities,** *Antarctic journal of the United States,* 1983 18(5), p.134-135, 1 ref.

An experiment to measure the flux of heat across the Ross Sea continental shelf and under the Ross Ice Shelf began in the 1982-83 austral summer. Data were collected aboard the USCGC Glacier and through holes in the sea ice at McMurdo Sound. The observations carried out are summarized. Hydrographic data indicated that the "warm core" observed in historical transects was present, and three current meter moorings were set to measure the heat flux of that core. The moorings will be recovered and reset along with additional arrays during January of 1984.

J-30517

Gordon, A.L., **Weddell Gyre,** *Antarctic journal of the United States,* 1983 18(5), p.135-136, 5 refs.

Data collected from observations of the Weddell Gyre are reviewed. The U.S.-U.S.S.R. Weddell Polynya Expedition of 1981 aboard the Soviet ship *Somov* obtained an array of *in situ* conductivity-temperature-depth-oxygen sensors/rosette hydrographic stations, in conjunction with biological, chemical, sea-ice, and atmospheric data. Analyses of the hydrographic data lead to two studies in which the characteristics of the ocean below the sea-ice cover are described. Warm WDW cells were observed within the Weddell trough, which are believed to be derived from instability within the frontal zone. The *Somov* data also reveal that the surface mixed layer below the sea ice cover is undersaturated in O2 by as much as 1.1 ml/l. This deficit is believed to be a consequence of O2-poor (4.5 ml/l) WDW entrainment by the winter mixed layer. A mean annual heat flux of 15 w/sq m was determined with an annual fresh water demand of 46 cm/yr.

J-30518

Chen, C.T.A., **Distributions of dissolved calcium and alkalinity in the Weddell Sea in winter,** *Antarctic journal of the United States,* 1983 18(5), p.136-137, 18 refs.

Dissolved calcium and titration alkalinity were measured for the first time in the winter Weddell Sea as part of the US-USSR Weddell Polynya Expedition in 1981. Both properties show no vertical variation in the water column within the precision of the measurements. The average observed calcium value has been taken as the initial concentration of calcium for the deep waters in the northeast Pacific Ocean. The *in situ* CaCO3 dissolution rate is then calculated as 0.072 micromol/kg/yr, which agrees well with the values obtained from alkalinities in the northeast Pacific.

J-30520

Corliss, B.H., Thunell, R.C., **Carbonate sedimentation beneath the Antarctic Circumpolar Current,** *Antarctic journal of the United States,* 1983 18(5), p.141-142, 5 refs.

Calcium carbonate sedimentation beneath the Antarctic Circumpolar Current (ACC) was studied based on the analysis of four USNS *Eltanin* cores taken between 38 and 48 S latitude in the southeast Indian Ocean sector of the southern ocean. Calcium carbonate (CaCO3) content and planktonic foraminiferal fragmentation are used to determine a record of calcium carbonate sedimentation over the last 440,000 years. The fragmentation records are compared with a history of deep-water circulation within the ACC based on deep-sea benthonic foraminifera from these cores to determine if there is any relationship between carbonate dissolution and deep-water circulation conditions during the Late Quaternary. The benthonic foraminiferal faunas during interglacial times are similar to those presently found in the area, indicating that interglacial deep-water circulation was similar to present-day conditions. By contrast, the *Melonis-Uvigerina* assemblage indicates a water mass within the glacial ACC which was distinctly different from the present-day Circumpolar Deep Water.

J-30541

Smith, W.O., **Oceanography of the antarctic marginal ice zone,** *Antarctic journal of the United States,* 1983 18(5), p.190-192, 1 refs.

Studies of the causes and spatial extent of ice-edge phytoplankton blooms conducted onboard the *Glacier* north of McMurdo Sound are summarized. Water samples were collected for measurements of salinity, nutrients, chlorophyll *a*, particulate carbon, nitrogen, and silicon, phytoplankton taxonomy, primary productivity, nutrient uptake rates, and conductivity/temperature profiles. Chlorophyll/temperature profiles indicate that, in regions of melting pack ice, a stable surface layer was created which then became the site of active phytoplankton growth and accumulation.

Foster, T.D., Middleton, J.H., **Oceanographic structure of the eastern Scotia Sea—I. Physical oceanography,** *Deep-sea research,* May 1984 31(5A), p.529-550, 16 refs.

Lines of closely spaced hydrographic stations across the boundary region in the eastern Scotia Sea between waters flowing out of the Weddell Sea and those flowing through the Drake Passage were occupied in the austral summer of 1981. A clearly defined front between the two waters was not observed except in the section just north of the South Orkneys near where the two currents evidently first come together. Downstream of this front is a region of eddy-like structures that increases in width almost linearly with distance. Energy spectra of the geostrophic velocities show that the strengths of the eddies also increase downstream. The boundary region thus has some of the appearances of a turbulent shear layer induced by the difference in velocity between the two currents, but as the size of the eddies remains nearly constant, baroclinic instability may also contribute to their formation. Treshnikov, A.F., **Results of Soviet research in the southern ocean,** Antarctic Committee reports, No.17. Edited by G.A. Avsiuk, New Delhi, Amerind Publishing Co., 1984, p.99-116, TT 79-52012, For Russian original see 10J-21693 or 33-3620. 32 refs.

A history of Soviet Antarctic Expedition work in the southern ocean in the last 20 years is given. Over this period 1,500 oceanographical sampling points were used, hundreds of thousands of miles covered by echo sounding, characteristics of surface circulation studied over 35,000 miles, and deep circulation investigated at 26 stations. Bottom sediments were sampled at more than 500 stations and more than 200 measurements taken of sediment depth. Biological studies include more than 4,000 plankton and 400 benthic probes. These data allowed the geographical limits of the southern ocean to be established, the frontal zones and bordering seas defined, water masses identified, icebergs classified, sea ice masses located and tracked, and both surface and deep water circulation more completely charted. (Auth. mod.)

Kaplin, P.A., **Studies of ocean level fluctuations during postglacial time** [Problemy izucheniia kolebaniĭ urovnia okeana v poslelednikovoe vremia], Kolebaniia urovnia moreĭ i okeanov za 15,000 let. (Sea and ocean level fluctuations for 15,000 years). Edited by P.A. Kaplin, R.K. Klige, and A.L. Chepalyga, Moscow, Nauka, 1982, p.6-11, In Russian. 7 refs.

Ocean level fluctuations during postglacial time are studied in relation to economic development of coastal areas. Theories and new models of the world ocean level are offered for the development of postglacial transgression. References to Antarctica, concerning the position of the western part of the ice sheet, imply sinking of the continental surface below sea level. The low hypsometric level of the surface reflects the initial position of dry land rather than isostatic ice loads. Under such conditions of ice-edge instability, its break off the main mass and rapid deterioration is possible, and due to atmospheric temperature and composition, this may occur during the next 50 years, causing general elevation of the world ocean level. Possibilities of rapid "surges" of large ice masses were substantiated, their causes are discussed, including sudden equilibrium upsets at the ice sheet edge at certain values of the rate of ice flow, friction, ice cover thickness and the form of the sheet.

DLC GC89.K63

Based on analysis of a three-dimensional thermohydrodynamic ice-sheet model, quantitative estimates of sea level changes due to warming of climate are presented. Oxygen isotope data from 15 to 20 thousand year old ice, showing a 5 deg decrease of temperature in Antarctica, also show a decrease of precipitation rate by a factor of 1.9. Tabulated data show the relationship between temperature and the increase of precipitation to be 14% to 1 deg C. Significant destruction of the ice sheet would begin only if temperatures were to increase by 10-12 deg. The maximum sea level rise in such an event would be 60 m.

Sievers, H.A., Nowlin, W.D., Jr., **Stratification and water masses at Drake Passage,** *Journal of geophysical research,* Nov. 20, 1984 89(C6), p.10,489-10,514, 59 refs.

Vertical sections of closely spaced oceanographic stations made across Drake Passage in the summers of 1975 and 1976 produced quality measurements of temperature, salinity, oxygen, silicate, nitrate, and phosphate. Based on these data, a traditional description of characteristic distributions is presented. Good sampling resolution in the vertical allows maxima in hydrostatic stability to be traced laterally (approximately along isopycnals) between individual stations. Eleven strata of maximum stability are identified. Most vertically separate distinct water masses. The most pronounced stability stratum is associated with the seasonal pycnocline. The densest water mass found is Weddell Sea Deep Water, which flows through a gap in the South Scotia Ridge and along the southern Scotia Sea to fill the trough in the southern Drake Passage. It is overlain by a laterally continuous stratum of relative maximum stability. (Auth. mod.)

Kennett, J.P., **Paleo-oceanography: global ocean evolution,** *Reviews of geophysics and space physics,* June 1983 21(5), p.1258-1274, U.S. National report to IUGG, 1979-1982. Refs. p.1269-1274.

Paleoceanography, one of the youngest branches of earth sciences, is concerned with the development of oceanic circulation through geologic time. This is a multifaceted and integrated endeavor since none of the subdisciplines is easily separated from the others. The field is holistic in character, and includes the history and effects of bottom, intermediate and surface circulation patterns, planktonic and benthonic biogeographic development and rates of organic evolution, the history of biogenic productivity and dissolution and their effect on sediment distribution and the consequences of sea level change. Paleoceanography was largely born of the Deep Sea Drilling Project (DSDP) and continues to be nourished by it. This article is a brief overview of a number of advances that have occurred in paleoceanography and related fields during the period from 1979 to 1982. Specific topics addressed include: paleoreconstructions, chronostratigraphy, biostratigraphy and evolution, stable isotope studies, sea-level history, deep paleocirculation and significant events and features identified from cretaceous oceans upward through the Holocene deglaciation.

Lutjeharms, J.R.E., Emery, W.J., **Detailed thermal structure of upper ocean layers between Capetown and Antarctica during the period Jan.-Feb. 1978,** *South African journal of antarctic research,* 1983 Vol.13, p.3-14, In English with Afrikaans summary. 36 refs.

Two hydrographic sections consisting of closely spaced expendable bathythermograph stations have been undertaken between Cape Town and Antarctica. Surface salinities and continuous surface temperature measurements were undertaken simultaneously. The results show detail of the thermal fronts in this oceanic area and these are discussed in the light of previous comparable measurements. (Auth.)

Kort, V.G., **Temperature anomalies in the southern ocean** [Temperaturnye anomalii v IUzhnom okeane], *Sovetskaia antarkticheskaia ekspeditsiia. Informatsionnyĭ biulleten',* 1984 No.105, p.5-11, In Russian.

The relationship between prolonged water temperature anomalies and atmospheric circulation and pressure is discussed; the correlation coefficients are tabulated. Measurements of southern ocean surface temperature, carried out from Jan.-Sept. 1979, show 31 prolonged anomalies over an area of between 1300 and 2500 km. 16 anomalies, lasting between 10 and 30 hours, are warm, with an average fluctuation of between 2.3 and 4.2 deg C; the other 15, lasting between 30 and 100 hours, are cold and fluctuate between -0.1 and -3.4 deg C. Maximum values reach 6.2 and -6.7 degrees.

Dmitrash, Zh.A., Ionov, V.V., Rebenkova, O.A., **Use of satellite TV images for location of oceanic fronts** [Opyt ispol'zovaniia sputnikovoĭ TV informatsii dlia opredeleniia mestopolozheniia okeanicheskogo flota], *Sovetskaia antarkticheskaia ekspeditsiia. Informatsionnyĭ biulleten'*, 1984 No.105, p.29-32, In Russian. 4 refs.

Study of cloud formations is reported, from data collected by satellite, which permitted to determine the location of the hydrological front, showing the zone of maximum horizontal gradients to be between latitudes 57 and 56 S, where the temperature dropped by 2.5 deg (from 3.7 to 6 deg). It was also found that the seasonal position of the polar front differs from the climatological position shown in the *Antarctic Atlas* by 3 deg of latitude.

Loynes, J., Potter, J.R., Paren, J.G., **Current, temperature, and salinity beneath George VI Ice Shelf, Antarctica,** *Deep-sea research*, Sep. 1984 31(9), p.1037-1055, 20 refs.

Speed, direction, temperature, and conductivity were recorded from February to July 1980 within the thermocline near the northern ice front of George VI Ice Shelf. There were no significant changes in temperature or salinity from summer to winter. Fluctuations of around 10 and 40 days periodicity were observed in the current and temperature, and similar variations are evident in meteorological observations. Temperature oscillations were observed at tidal frequencies and may be caused by horizontal advection or internal wave motion. The horizontal kinetic energy is dominated by low-frequency periods (46%), semi-diurnal tides (40%), and diurnal tides (10%). Tidal ellipses have their major axes aligned along George VI Sound and are described anticlockwise. Terdiurnal constituents, which may be a particular effect in the response of a floating ice shelf to tide generating forces, were observed. The M2 constituent was highly suppressed. Both the amplitude of M2 current and the speed of the mean flow decreased sharply in mid-April. These changes may be related to increasing sea-ice cover with the onset of winter. The mean flow is directed eastwards across the narrow channel, parallel to the ice front and at right angles to the major axes of the tidal ellipses. We speculate on reasons for this unusual behaviour. (Auth.)

Smith, N.R., Zhaoqian, D., Kerry, K.R., Wright, S., **Water masses and circulation in the region of Prydz Bay, Antarctica,** *Deep-sea research*, Sep. 1984 31(9), p.1121-1147, 62 refs.

Hydrographic and expendable bathythermograph (XBT) measurements are used to describe the characteristics and circulation of the water within and to the north of Prydz Bay. Surface waters in Prydz Bay are highly variable and are linked to local ice conditions. The isolation of a warm surface feature corroborates previous suggestions of a permanent high surface temperature anomaly. Water mass analysis reveals both high- and low-salinity varieties of continental shelf water and a significant Ice Shelf Water mode. Low-salinity shelf water is confined to the West Ice Shelf region and high-salinity shelf water to the central and western areas of Prydz Bay. The Ice Shelf Water mass is related to freezing beneath the Amery Ice Shelf and to prolonged isolation due to topographic restraints. Geostrophic calculations show predominantly westward flow adjacent to the continental rise and a large cyclonic gyre in Prydz Bay. The off-shelf pattern is consistent with previous calculations from hydrographic data and with iceberg and buoy observations. The water masses and circulation within Prydz Bay resemble those of similar sites within the Weddell and Ross seas but there are significant differences. (Auth. mod.)

Michel, R.L., **Oceanographic structure of the eastern Scotia Sea—2. Chemical oceanography,** *Deep-sea research*, Oct. 1984 31(10), p.1157-1168, For Part 1 see 14J-30596. 15 refs.

During this 1981 multidisciplinary study samples were analyzed for silicate, nitrate, and tritium. Most silicate sections showed a pronounced increase in concentrations from north to south in the surface waters. A frontal-type structure in the temperature and salinity fields in the section just north of the South Orkneys, where water flowing through the Drake Passage meets that from the Weddell Sea, is mirrored in the silicate section. Further downstream the silicate sections show no distinct trends in the deep waters, but the distributions are characteristic of meso-scale eddies. No significant horizontal gradients are evident in the nitrate sections, but a nitrate maximum is present in all sections, generally between 200 and 300 m. Tritium profiles are presented for eight stations on two of the sections. Surface tritium concentrations are low (0.3 to 0.4 TU) with the highest concentrations in the north. There was substantial tritium at two stations on the most western section, indicating up to 50% of the deep water may have come from the surface since the early 1960s. On the section to the east, tritium concentrations dropped rapidly below the temperature minimum, and there was essentially no tritium in deep waters. At most, 10% of the deep waters could have come from the surface since the advent of nuclear testing. (Auth.)

Bersch, M., Becker, G.A., **Upper layer thermal structure in the Atlantic sector of the southern ocean,** *Deutsche hydrographische Zeitschrift*, 1984 37(2), p.71-86, With German and French summaries. 27 refs.

On the basis of 7 XBT sections of South America-Antarctica and South Africa-Antarctica the variability of the Subtropical Convergence (STC), the Polar Frontal Zone (PFZ) and the Weddell-Scotia Confluence (WSC) are particularly discussed. Between 45 W and 56 W, the STC is shifted to the South by 2.3 degrees of latitude confining a tongue of subtropical surface water near the continental slope of the Patagonian shelf. Further South, the PFZ is displaced to the North by 7 degrees of latitude between 58 W and 39 W. An intense Subantarctic Front has been observed northwestwards of South Georgia. Even East of the South Sandwich Islands the WSC can be detected by a positive temperature anomaly. (Auth.)

Nishiyama, T., **Idea on extraction of uranium from seawater using the drift of icebergs**, *Tokyo. National Institute of Polar Research. Memoirs,* Sep. 1984 Special issue No.33, p.184-186, 7 refs.

On recovering uranium from seawater, one of the most radical problems awaiting solution is how to contact economically an enormous quantity of seawater with absorbents. In this paper a new method of mechanical cable-bucket system combined with the drift of icebergs is discussed. In order to determine the amount of recoverable uranium, an iceberg of 1 km in length and drifting at 1 kt was chosen. A 5-km loop with absorbent buckets attached at 3 m intervals was hung over the iceberg. Assuming that absorption efficiency is 30% and desorption efficiency 90%, the amount of uranium produced by this recovery process is estimated to be 77 t a year. (Auth.)

Treshnikov, A.F., Krutskikh, B.A., Nikiforov, E.G., Zakharov, V.F., Nikolaev, IU.V., **Problems of polar oceanology** [Aktual'nye problemy poliarnoĭ okeanologii], Issledovanie okeana (Studies of the ocean) edited by L.M. Brekhovskikh and E.M. Kukharkov, Moscow, Nauka, 1984, p.38-53, In Russian. 20 refs.

Soviet oceanographic investigations in the polar regions during the past decades are reviewed. The principal economic interest of those in the Antarctic was the utilization of biological resources of the southern ocean, which required studies of long-range ice, weather and climatic forecasts, and of problems related to the role of the ocean in energy balance of the southern polar region. The POLEX-South-81 expedition, performed complex hydrometeorological studies in the Australian sector, where air-mass transfer and the development of meridional processes were often disturbed; its program also included studies of the Antarctic circumpolar current, and the formation of the Antarctic Bottom Waters. Investigations performed were more of an exploratory nature, and similar studies continued in the Weddell Sea in 1981-82.

Pillsbury, R.D., Bottero, J.S., **Observations of current rings in the antarctic zone at Drake Passage,** *Journal of marine research,* Nov. 1984 42(4), p.853-872, 23 refs.

Time series of current velocity and temperature from several depths at a site near the center of Drake Passage show features that can plausibly be interpreted as current rings. Between June 1975 and January 1976, five cyclonic rings from the Continental Water Boundary and one anticyclonic ring from the polar front passed over the site. The diameters of the rings varied from 30 km to 130 km, and all of them extended vertically to a depth of at least 2500 m. The rings exhibited maximum spin velocities of about 20 cm/sec at 1000 m depth and 10 cm/sec at 2500 m. Their translatory motion, which was toward the north at about 4 cm/sec, contained a westward component relative to the ambient flow. The magnitude of the westward component suggests that it may have resulted from an interaction between rings and the sea floor, which slopes downward to the northeast at the mooring site. The current rings may play an important role in dissipating the kinetic energy of the circumpolar fronts and they may be responsible for a significant poleward flux of heat in the southern ocean. Szekielda, K.-H., **Satellite investigations on the fluctuations of the subtropical and antarctic convergence zones,** *Deutsche hydrographische Zeitschrift,* 1983 36(1), p.25-43, French and German summaries. 11 refs.

Investigations have been made using GOSSTCOMP (Global Ocean Sea Surface Temperature Computer Program) data in the area of the subtropical and antarctic convergence zones. The study showed that the positions of both boundaries undergo oscillations in E-W direction and it is assumed that the circumpolar current may act on both boundaries of the convergence zones. Since it seems that the antarctic convergence zone is not as stable as has been postulated before, it is suggested that unstable waves, gyres and interaction of different water bodies are the major causes of the observed changes in the location of the two zones. (Auth.)

Schröder, M., **Characteristics of a salinity front in the eastern Bransfield Strait, the source region of the Weddell-Scotia Confluence** [Beschreibung einer Salzgehaltsfront in der östlichen Bransfield-Strasse, dem Ursprungsgebiet der Weddell-Scotia-Konfluenz], *Deutsche hydrographische Zeitschrift,* 1983 36(6), p.217-235, In German with English and French summaries. 12 refs.

Hydrographic data of the near-surface layer (0-200 m) are presented, which were measured in a small area within the Bransfield Strait during December 1980 by RV *Meteor* as part of cruise No.56. Profiles and two vertical sections show a sharp salinity front (delta S = 0.3), in a northeast direction, extending to a maximum depth of 120 m. Two main water masses obtain: cold and saline water of the Weddell Sea coming from the south, and warmer, less saline water of the Bransfield Strait in the northern part of the front. Comparisons with historical hydrographic stations suggest that this front is a continuous phenomenon, which may possibly be the origin of the Weddell-Scotia Confluence extending out of this area as far as 30E. (Auth.)

MacAyeal, D.R., **Potential effect of CO2 warming on sub-ice-shelf circulation and basal melting,** Environment of West Antarctica: potential CO2-induced changes; report of a workshop, July 1983, Washington, D.C., 1984, p.212-221, PB85-110 757, 8 refs.

The author argues, and is supported by others, that the key link in the chain that binds shelf ice to West Antarctica is the state of the ocean beneath the shelves. If there should be sufficient warming of those waters through advective currents, accelerated melting of the ice shelves from below could result. Present knowledge of sub-ice shelf currents is reviewed and a priority list of research to expand that knowledge is presented.

Whitman, J.M., Harrison, C.G.A., Brass, G.W., **Tectonic evolution of the Pacific Ocean since 74 Ma,** *Tectonophysics,* Dec. 1983 99(2-4), p.241-249, 14 refs.

DLC QE500.T4

For the Pacific Ocean, Plate motions are determined back to 74 Ma. This time marks the initiation of spreading at the Pacific-Antarctic Ridge which caused the separation of the Campbell Plateau from Antarctica. Thus, this time is the earliest fix on the position of the Pacific plate relative to the continents surrounding the Pacific Ocean basin using sea-floor spreading. Since it is not possible to derive quantitative information about the relative motion between two plates separated by a trench all rotations for the oceanic plates of the Pacific Basin are calculated relative to the Pacific plate and then relative to North America through the plate circuit. (Auth. mod.)

Malek, V.N., **Diagnostic calculations of water circulation in the Australian-New Zealand sector of the southern ocean based on data from the POLEX-South-81 experiment,** *Oceanology,* 1983 23(3), p.323-326, Translated from Okeanologiia. 13 refs.

An attempt is made in the context of a linear diagnostic model to study the three-dimensional water circulation in the Australia-New Zealand sector of the southern ocean during the summer of 1981. The calculations are based on the temperature and salinity fields obtained in hydrological surveys, with 1 deg and 2.5 deg grid steps in latitude and longitude, respectively. The water circulation in this area of the ocean is shown to have a complex structure, the Antarctic Circumpolar Current being the main element of the upper 1-km layer. In the deeper layers, meridional flows and eddy formations predominate. The current patterns are presented. (Auth.)

Tchernia, P., Jeannin, P.F., **Circulation in antarctic waters as revealed by iceberg tracks 1972-1983,** *Polar record,* Sep. 1984 22(138), p.263-269, 4 refs.

Successively using positioning satellites Eole, Nimbus F, Tiros N-Argos, movements of 21 Antarctic icebergs were monitored daily from radio transmissions; 17 of the bergs were followed over periods of 228-828 days through distances of 1600 to 8000 km. Mean daily positions, calculated from several observations, were accurate to less than 5.5 km for Eole and Nimbus, 0.9 km for Argos. Grouped into three areas (Weddell Sea, Enderby Land to Adélie Land, Ross Sea), the trajectories cover four fifths of the continental periphery. Movements clearly indicate singular points along the boundary between the two circumpolar currents, the East Wind and West Wind drifts, and variations in the strength and direction of flow of these currents; submarine topography and other underlying causes are suggested. (Auth.)

Marra, J., Boardman, D.C., **Late winter chlorophyll *a* distributions in the Weddell Sea,** *Marine ecology progress series,* Oct. 1984 19(3), p.197-205, 55 refs.

Chlorophyll *a* measurements were made in 3 different environments: beneath the pack ice, in pack ice cores, and in the water column in the ice edge zone (IEZ). Phytoplankton photosynthesis measurements were made on samples from beneath the pack ice and from a station at the IEZ. Chlorophyll *a* values in the mixed layer beneath the pack ice average 12 mg/sq m. Within the IEZ (at 6/10's coverage) water column chlorophyll *a* doubles. Compared to values beneath the pack ice, the IEZ is characterized by a localized ten-fold increase in surface chlorophyll *a*. Photosynthesis parameters likewise increase at the ice edge, and a rate of primary production of 300 to 400 mg/sq m/d is estimated for this region. Significant amounts of chlorophyll *a* are found near the base of the pack ice column, and evidence is presented which suggests an active biological community living within the pack ice. Overall, the data are consistent with the idea that phytoplankton distributions are regulated by the availability of light. Furthermore, the data indicate the importance of the IEZ to primary production in the southern ocean. (Auth.)

Bryden, H.L., Heath, R.A., **Energetic eddies at the northern edge of the Antarctic Circumpolar Current in the Southwest Pacific,** *Progress in oceanography,* 1985 Vol.14, Essays on oceanography. A tribute to John Swallow. Guest editors J. Crease, W.J. Gould and P.M. Saunders, p.65-87, 30 refs.

Two-year time series measurements of current and temperature were made at the northern edge of the Antarctic Circumpolar Current in the southwestern Pacific from 1978 to 1980 to investigate eddy heat and momentum fluxes in the circumpolar region. The measurement site near 49 30 S 170 W is at a transition zone or front between subantarctic and subtropical waters in which meridional temperature and salinity gradients and, hence, vertical shear in eastward velocity extend down to 2,000 m depth. Energetic eddies are found to have typical amplitudes of 20 cm/s at 1,000 m depth, to be vertically coherent over the depth range from 1,000 to 5,000 m, to vary over temporal scales of 20 days and horizontal scales of 60 km and to propagate southeastward at about 12 cm/s. Like Drake Passage eddies, these eddies transport a significant amount of heat poleward in the band of periods between 20 and 50 days, but this band does not dominate the spectrum the way it does in Drake Passage. Kroopnick, P.M., Margolis, S.V., Wong, C.S., **Delta C-13 variations in marine carbonate sediments as indicators of the CO2 balance between the atmosphere and oceans,** Fate of fossil fuel CO2 in the ocean. Edited by N.R. Andersen and A. Malahoff, New York, Plenum Press, 1977, p.295-321, Refs. p.319-321.

DLC GC117.C37F37

A model is presented to explain the departures from equilibrium of the ocean-atmosphere CO2-C-13 system with respect to temperature, latitude and water mass characteristics. Carbon isotope data suggests that invasion and evasion of CO2 to and from the sea is at least partially controlled by the organic productivity of a water mass. Surface water delta C-13 values are determined by exchange with the atmosphere and by the amount of carbon removed versus that replenished. Deeper water delta C-13 values are controlled by the relative rates of upwelling of deep water, by *in situ* respiration, and by the dissolution of settling particles. The record of delta C-13 fluctuations for the last 75 million years in oceanic surface and bottom waters is recorded in the calcareous remains of benthic and planktonic foraminifera and in nannofossils. Hay, W.W., Southam, J.R., **Modulation of marine sedimentation by the continental shelves,** Fate of fossil fuel CO2 in the ocean. Edited by N.R. Andersen and A. Malahoff, New York, Plenum Press, 1977, p.569-604, Refs. p.603-604.

DLC GC117.C37F37

Estimates of the magnitudes of fluctuations in the mechanical and chemical loads of rivers through geological time are obtained by considering the relation between river loads and area, elevation, hypsography and climate of the present continental configuration. On long time scale it is shown that the continental shelves bypass material to deeper oceanic accumulation sites. However, for periods of rapidly rising sea level following glaciations, the sedimentation regime operates in such a way that continental margins consume a flux of CaCO3 equal to or several times larger than the input from rivers. J-31435
Deacon, G., **Antarctic circumpolar ocean,** Cambridge, University Press, 1984, 180p.
DLC GC461.D4

The first part of this book deals with the pioneering observations of the early explorers of Antarctica and its surrounding waters, and of the sealers and whalers who profited from the new discoveries, the observations made by polar explorers, and the systematic studies of oceanographic expeditions. The second part summarizes present knowledge of the water movements and their effects on temperature and salinity distribution, biological productivity, distribution of marine plants and animals, climate and ice cover. It is shown how present knowledge has grown from earlier findings, and how it relates to economic problems, such as the conservation of marine living resources.

Horton, S.K., **Refraction of wave packets by currents,** *Florida Institute of Technology. Department of Oceanography and Ocean Engineering. Technical report,* Apr. 1982 No.JEB-9, 96p., ADA-133 366, Master's thesis. 16 refs.

The refraction of wave packets by ocean surface currents is investigated using a refraction method based on Snell's law with geometric group velocity. This method requires curvature equations for the directions of the wavelets and wave packets and an advection equation for the direction of the ray. These equations are derived and applied to idealized current models. The current models are patterned after the Gulf Stream and Circumpolar Current. (Auth. mod.)

Deacon, G.E.R., **Oxygen in antarctic water,** *Deep-sea research,* Nov. 1984 31A(11), p.1369-1371, 14 refs.

Surface water in the northern part of the Antarctic zone and the tongues of Antarctic intermediate water farther north are fairly rich in oxygen, but Antarctic bottom water, though the principal aerator at the bottom of the Indian and Pacific oceans, is relatively poor in oxygen. The North Atlantic water, foremost in the Atlantic Ocean, is oxygen-rich because it sinks in areas fed by surface currents. Antarctic bottom water is oxygen-poor because its source areas are fed largely by deep currents. (Auth.)

Lutjeharms, J.R.E., Valentine, H.R., **Southern ocean thermal fronts south of Africa,** *Deep-sea research,* Dec. 1984 31A(12), p.1461-1475, 62 refs.

A statistical analysis of the surface thermal characteristics of the major oceanic fronts in the southern ocean sector south of Africa has been carried out. The mean latitudinal locations, middle temperatures, and temperature gradients are presented for the Agulhas Front, the Sub-Tropical Convergence, the Sub-Antarctic Front, and the Antarctic Polar Front, based on 89 crossings. Wherever possible, the surface and subsurface expressions of fronts have been compared. It is shown that all four fronts have consistent and narrow thermal surface characteristics, making it possible to identify and locate their surface expressions by surface temperature measurements alone. The surface temperature traces across the Sub-Antarctic Front, and to a lesser extent across the Antarctic Polar Front, often show inversions north and south of the main horizontal gradient demarcating the front. The subsurface expressions of both the Sub-Tropical Convergence and the Antarctic Polar Front are located predominantly north of the surface expressions. It is shown that the Agulhas Front has only a limited longitudinal distribution and these limits are established. (Auth.)

Everson, I., **Areas of seabed within selected depth ranges in the south-west Atlantic and Antarctic Peninsula regions of the southern ocean,** Cambridge, British Antarctic Survey, 1984, n.p.

Bathymetric data are presented for the region enclosed within 25-78W between 50 and 70S, encompassing the Scotia Arc and Antarctic Peninsula regions. Contours were drawn on Admiralty Charts at 50, 150, 250 and 500 meter depths. FAO sub-areas were marked in and each sub-area divided into rectangles for the analyses. Data are presented in tables which give subdivisions, coordinates, % of sea area in each of five depth ranges, and the sea area covered in sq km. 15 tables are used to present the data; Table 16 lists Admiralty Charts used, and Table 17 gives a more detailed analysis of subdivisions 50, 51, and 52 of FAO sub-area 48.3.

Gamberoni, L., Geronimi, J., Murail, J.F., **Hydrological structure of the immediate surroundings of Reunion Island during winter (Aug.-Sept. 1982)** [Structure hydrologique aux abords immédiats de l'île de la Réunion en période hivernale (août-sept. 1982)], *Comité national français des recherches antarctiques. CNFRA,* 1984 No.55, p.41-47, In French with English summary. 4 refs.

During the August-September 1982 MD 32 cruise around Reunion Island, hydrological data were collected at less than 35 miles from the coast. These data show a contrast in the surface thermal structure between the warm waters in the northwest and the relatively cold waters in the southeast of the island. The same situation has been observed in April 1979 (off season) but in August 1977, off northwest coast, the temperature gradient was reversed. The topography of the isotherms seems also to indicate the existence of a current along the southeast coast. (Auth.)

Thomson, R.B., **Oil pollution in the Antarctic,** Symposium on Antarctic Logistics, 3rd, Leningrad, 1982. Proceedings, Scientific Committee on Antarctic Research, [1983], p.523-535, Refs. p.527-535. This is a reading list on effects of oil pollution on a marine polar environment.

Future activities connected with antarctic mineral resource exploration and exploitation, and their likely impact on the environment, are considered. They include the need for a base on nearby land from which to support off-shore operations which, in turn, would require ship mooring facilities, workshops, large generators and heating systems, and a large number of people. It is suggested that a great deal can be learned on the subject from literature available from experience in the Arctic, and a reading list to this effect is provided. Answers to some of the questions concerning oil pollution, directed by Antarctic Treaty governments to SCAR, are provided in the Report of the XIth Antarctic Treaty Consultative Meeting, which is partly reproduced here.

Nowlin, W.D., Jr., Worley, S.J., Whitworth, T., III, **Methods for making point estimates of eddy heat flux as applied to the Antarctic Circumpolar Current,** *Journal of geophysical research,* Mar. 20, 1985 90(C2), p.3305-3324, 18 refs.

Yearlong current and temperature measurements in Drake Passage were used in this study. Misleading results can be produced by an assortment of mal- and misfeasances which must be overcome: failure to correct measurement errors; insufficient consideration given to the time series studied and the coordinate system used; moorings blown over; low-frequency contamination of eddy heat fluxes. These are discussed at length and their effects on the various aspects of eddy heat fluxes are examined. Comparison with earlier measurements in the area shows considerable differences. However, other evidence indicates that a legitimate large interannual variability cannot be discounted.

Rohardt, G., Augstein, E., **Hydrography at the edge of Filchner Ice Shelf** [Hydrographie vor dem Filchner Schelfeis], Filchner-Ronne Ice Shelf programme, Report 2 (1985), H. Kohnen, comp, Bremerhaven, Alfred Wegener Institute for Polar Research, 1985, p.50-57, In German with English summary. 3 refs.

Hydrographic measurements along the front of the Filchner Ice Shelf confirm earlier Norwegian findings. Near Filchner Station they show a relatively warm water mass which is trapped by cold ice shelf water to the east and west. Data from the eastern part of the Filchner depression support the circulation model of earlier investigators. The 26 hour record of a station at the ice edge with two hourly CTD profiles reveals a clear semidiurnal tidal signal in the temperature measurements. (Auth.)

J-31637

Nemoto, T., **Ecological system of antarctica** [Nankyokukai no seitaikei], *Chiri,* March 1983 38(3), p.33-44, 9 refs., In Japanese.

As a water mass enveloping the antarctic continent, the Antarctic Ocean forms a peculiar ecological system. In general, the Antarctic Ocean can be thought of as the ocean between the Antarctic Convergence and Antarctica. Further, the ocean region between the Antarctic Convergence and Subantarctic Convergence is called Subantarctic Ocean. The region south of the Subtropical Convergence is called southern ocean, which lies south of 40 degrees S. latitude. With the Antarctic Convergence as the boundary, the Antarctic Ocean displays a remarkably low temperature, and owing to the melting of the ice, it becomes of low salinity in summer, and the nutrient salts such as silicate, phosphate, and nitric acid increase. The special characteristics of the structure and environment of the Antarctic Ocean are described, and details on the primary productivity, phytoplankton, zooplankton, marine birds, mammals, and the ecological food chain of the Antarctic Ocean are presented.

Williams, D.F., Healy-Williams, N., Leschak, P., **Dissolution and water-mass patterns in the Southeast Indian Ocean, Part 1: Evidence from Recent to Late Holocene foraminiferal assemblages,** *Geological Society of America. Bulletin,* Feb. 1985 96(2), p.176-189, 51 refs.

A quantitative study of the planktonic foraminiferal fauna and various related parameters in more than 100 surface sediment samples from the Southeast Indian Ocean has identified the major relationships which can be utilized to reconstruct past changes in water-mass boundaries and degree of CaCO3 dissolution. The samples represent Recent to late Holocene sedimentation in water depths from <1,000 to more than 5,000 m and from 30S to 65S latitude. The transitions between the Antarctic fauna and Subantarctic fauna and the transitional-subtropical fauna, accurately reflect the water-mass boundaries of the Polar Front and Subtropical Convergence, respectively, and provide useful indicators for paleoceanographic reconstructions. (Auth. mod.)

Williams, D.F., Gribble, D., Healy-Williams, N., Leschak, P., **Dissolution and water-mass patterns in the Southeast Indian Ocean, Part 2: The Pleistocene record from Brunhes to Matuyama age sediments,** *Geological Society of America. Bulletin,* Feb. 1985 96(2), p.190-202, Refs. p.202.

Calcium carbonate dissolution patterns were determined for portions of the past 2.5 m.y. in 9 *Eltanin* piston cores distributed along the Southeast Indian Ridge in the Southeast Indian Ocean. Oxygen isotope and foraminiferal faunal records were used to determine the relationship between paleoclimate water-mass changes and the dissolution invervals. CaCO3 dissolution was generally more intense during glacial periods, but dissolution pulses of short duration also occur during several interglacial periods, particularly on the shallower portions of the Southeast Indian Ridge. The glacially related increases in dissolution are in-phase with northern migrations of the Polar Front. During the past 250,000 yr, the Polar Front has migrated to 45S latitude in the region south of Australia and as far north as 40S in the mid-southern Indian Ocean during the same time period. Apel, J.R., Wilson, W.S., **Review of major scientific results from U.S. satellite altimetry and projections for the future,** *Marine geophysical researches,* 1984 7(1/2), p.1-16, 12 refs.

Precision radar altimeters have been flown on three U.S. satellites during the past decade. The initial purpose of the altimeter was to relate the topography of the sea surface to currents and other oceanographic parameters. However, other geophysical fields have been derived as well, among them the marine geoid, marine gravity anomaly, surface wave heights, surface swell heights, and surface wind fields. Additionally, the altimeter has been used to deduce distributions of tidal amplitudes, the position of sea ice around the antarctic continent and topography of the Greenland Ice Cap. (Auth.)

J-31718

Cheney, R.E., **Applications of satellite altimetry to oceanography and geophysics,** *Marine geophysical researches,* 1984 7(1/2), p.17-32, 19 refs.

Using all available Geos-3 and Seasat altimeter data, mean sea surfaces and geoid gradient maps have been computed for the Bering Sea and the South Pacific. When enhanced using hill-shading techniques, these images reveal in graphic detail the surface expression of seamounts, ridges, trenches, and fracture zones. Existing models and data have been used to derive realistic global circulation solutions. (Auth. mod.)

Engelis, T., Rapp, R.H., **Global ocean circulation patterns based on Seasat altimeter data and the GEML2 gravity field,** *Marine geophysical researches,* 1984 7(1/2), p.55-67, 15 refs.

The Seasat altimeter data has been completely adjusted by a crossing arc technique to reduce the crossover discrepancies to approximately 30 cm in five regional adjustments. This data was then used to create sea surface heights at 1 deg intersections in the ocean areas with respect to the GRS80 ellipsoid. A geoid corresponding to these sea surface heights was computed, based on the potential coefficients of the GEML2 gravity field up to deg 6, augmented by Rapp's coefficients up to deg 180. The differences between sea surface heights and the geoid were computed to give approximate estimates of sea surface topography. The direction of current flow can be computed on a global basis using the spherical harmonic expansion of the sea surface topography. This has been done, not only for Seasat/-GEML2 estimates, but also of the two solutions are very similar and agree well with the major circulation features of the oceans. (Auth. mod.)

Stubbs, L.C., Boyd, J.S., Bond, F.R., **Measurement of the OH rotational temperature at Mawson, East Antarctica,** *Planetary and space science,* Aug. 1983 31(8), p.923-932, 36 refs.

Measurements of the hydroxyl rotational temperature for the (8.3) meinel band are reported for observations made at Mawson, East Antarctica (67 deg 36 min S, 62 deg 53 min E) over the austral winter of 1979. Mean values of the rotational temperature are given for 54 nights. The average value lies in the range 160-170 K. The measured temperatures appear lower than those that have been reported at similar latitudes in the Northern Hemisphere. A gradual decrease in the value of the temperature throughout the course of the evening is the only diurnal trend observed. There is little evidence for any impulsive heating associated with auroral activity. (Auth.)

Brittain, R., Kintner, P.M., Kelley, M.C., Siren, J.C., Carpenter, D.L., **Standing wave patterns in VLF hiss,** *Journal of geophysical research,* Sep. 1, 1983 88(A9), p.7059-7064, 15 refs.

Observations have been made of systematic patterns in VLF hiss, which can be interpreted as a standing wave pattern formed by reflection in the lower ionosphere. Multicomponent VLF electric and magnetic field experiments were flown on three sounding rockets from Siple Station during December 1980 to January 1981. One feature of the natural emissions was observed in a very similar form during each flight. A band of hiss, typically from 1.5 to 3 kHz, was seen on the upleg to form a series of closely spaced stripes with whistler-like dispersion. These first appeared at an altitude of 90-95 km and extended for as much as 40 km in altitude. On the downleg the stripes were observed at the same altitude with the pattern reversed in time. No such patterns were observed by the VLF receivers operating at the same time on the ground at Siple or at its conjugate point. It is suggested that the patterns are interference effects due to downcoming waves reflecting from a layer in the E region and forming a standing wave pattern. (Auth.)

Cazeneuve, H., Tabocchini, H.L., Pirán, M.M., **Influence of the interplanetary environment on auroral zones** [Regulación ejercida por el medio interplanetario en la zona auroral], *Buenos Aires. Instituto Antártico Argentino. Contribución,* 1983 No.285, 17p., In Spanish with English, French and German summaries. 10 refs.

The relationship among interplanetary conditions, magnetic activity and ionospheric absorption, recorded at Belgrano Station, is examined. Magnetograms of the horizontal component (H), riometer records and data of the interplanetary medium are used. It is found that the magnetic activity is generated by the combined effect of a variety of interplanetary conditions. The data indicate that each physical entity of the interplanetary medium plays a specific and precise role in the development of the active periods. Although the interaction among such diversified phenomena is unknown, it is inferred that the geomagnetic activity is a speedy response to variations of interplanetary conditions. (Auth.)

Kamada, T., **On the observation of conjugate points,** *Polar news,* Aug. 1983 No.37, p.27-30, In Japanese. 3 refs.

In this paper is described the importance of the observation of geomagnetic conjugate points, especially the aurora and its related phenomena. Because of the complexity of conjugacy of natural phenomena observed at the conjugate point, some examples having symmetric and/or asymmetric phenomena observed by many workers are shown. A long recognized need among Japanese researchers for conjugate observation of auroral related phenomena was realized with the establishment of the National Institute of Polar Research in Japan in September, 1973. Thereafter, much data about conjugacy were obtained. Finally, the author proposed to establish a stationary observation base in Iceland in the near future for conjugacy study, because Showa Station (Mag. Lat. -66.7, Mag. Long. 72.5) in Antarctica and Leirvogur (Mag. Lat. 66.6, Mag. Long. 71.2) in Iceland are the only conjugate pair points for an aurora and its related phenomena. (Auth.)

Carpenter, D.L., Miller, T.R., **Rare ground-based observations of Siple VLF transmitter signals outside the plasmapause,** *Journal of geophysical research,* Dec. 1, 1983 88(A12), p.10,227-10,232, 20 refs.

Signals from the Siple VLF transmitter observed at the conjugate ground station, Roberval, Canada, have previously been found to propagate either within the outer plasmasphere or within the region of steep plasmapause density gradients, but on paths with equatorial electron density that is within a factor of 2 of nearby plasmaspheric levels. Two cases in which propagation occurred just outside the plasmapause and at plasma trough density levels are reported. In one case a series of 1-s pulses and frequency ramps was observed; many of the pulses triggered risers with slopes of 10 kHz/s, much steeper than those usually observed within the plasmasphere. In the other case, no evidence of triggered emissions was seen on the Siple pulses, but instead efficient echoing occurred and noise band precursors to large wave bursts were initiated. (Auth.)

Helliwell, R.A., **Controlled stimulation of VLF emissions from Siple Station, Antarctica,** *Radio science,* Nov.-Dec. 1983 18(6), p.801-814, 21 refs.

Active VLF experiments at Siple Station are reviewed and ne findings on the role of wave coherence using the new two-frequency transmissions are reported. The primary purpose of Siple Station i to perform active experiments on VLF wave-particle interactions An important part of the program is the observation and interpretation of various VLF wave phenomena, including whistlers, chorus and hiss Related programs at Siple Station include riometers, geomagneti pulsations, ULF waves, photometers, and balloons and rockets. Recently a digital ionosonde was placed in operation at Siple. All ar coordinated in a program aimed at describing the behavior of th magnetosphere-ionosphere system and understanding its role in th generation of waves and wave-particle interactions.

Rodger, A.S., Morrell, C., Dudeney, J.R., **Studies of sporadic E associated with the main ionospheric trough,** *Radio science,* Nov.-Dec. 1983 18(6), p.937-946, 40 refs.

The occurrence of sporadic E under the main F-region trough has been established using ionograms from a vertical incidence ionosonde at Halley Bay, Antarctica (76 S, 27 W; L=4.2), a site well suited for such studies as the trough can be seen under a wide range of magnetic conditions and local times. Analysis shows that Es is very frequently observed under both the equatorward and poleward edges of the trough, as well as poleward of it. Additional information on the morphology, and dynamics of Es layers associated with the main trough is provided by detailed study of individual events using data from the British Antarctic Survey's advanced ionospheric sounder deployed at Halley Bay. Troitskaia, V.A., Bol'shakova, O.V., **Geomagnetic pulsations in the polar cusp** [Geomagnitnye pul'satsii v poliarnoĭ shapke], 25 let Sovetskoĭ antarkticheskoĭ ekspeditsii. (25 years of Soviet antarctic expeditions). Edited by E.S. Korotkevich and L.I. Dubrovin, Leningrad, Gidrometeoizdat, 1983, p.93-101, In Russian. 12 refs.

Geomagnetic pulsation studies carried out by Soviet scientists stationed in northern and southern polar regions are reported. Principal attention is paid to new types of fluctuation observed in the polar cusp in the low-frequency and high-frequency ranges of the spectrum. These fluctuations differ substantially from known types of geomagnetic pulsations typical of the auroral zone in middle latitudes.

(25 years of Soviet antarctic expeditions). Edited by E.S. Korotkevich and L.I. Dubrovin, Leningrad, Gidrometeoizdat, 1983, p.101-110, In Russian. 30 refs.

On the basis of established regularities in the occurrence of ionospheric anomalies in the Northern Hemisphere, data from ionospheric measurements in high latitudes in the Southern Hemisphere were analyzed. Synoptic maps of antarctic ionosphere anomalies, plotted in winter during intense solar activity, are presented. Ionospheric properties, linked with particle precipitations in auroral zones and with the influence of interplanetary magnetic field in the polar cusp area, are determined.

Francis, C.R., Strangeways, H.J., Bullough, K., **Discrete VLF emissions (7-9kHz) displaying unusual banded and periodic structure,** *Planetary and space science,* May 1983 31(5), p.537-557, 51 refs.

Rising frequency VLF emissions having unusually high frequency and exhibiting banded structure were recorded between 14.55 and 15.30 U.T. on 28 June 1972 by the VLF goniometer receiver at Halley, Antarctica. The risers were split into two frequency groups, one with frequencies in the range 6.0-7.7 kHz and the other with frequencies between 7.8 and 9.4 kHz, the former being more numerous. The gap between the lower and upper frequency risers is superficially similar to, though at a higher frequency than, the missing bands in emissions observed by satellites. However, it is found to be unlikely that the risers received at Halley can be explained by any of the mechanisms advanced to explain the banded satellite-observed emissions. Several other explanations are considered and it is shown that the most likely is partial suppression by magnetospheric line radiation propagating in the same duct. The risers are interpreted as being generated via cyclotron resonance with counterstreaming electrons. A computer program based on Helliwell's (1967) phenomenological theory is used to determine the generation region and electron energies involved. (Auth.)

Olson, J.V., **Signal detection in scalar arrays: application of adaptive, pure-state filters to infrasonic array data,** *Annales geophysicae,* July-Oct. 1983 1(4-5), p.371-373, 6 refs.

The performance of pure-state filters in signal detection was investigated, using data from an array of infrasonic microphones operated at Windless Bight, Antarctica by the Geophysical Institute, University of Alaska. In surveys of data spanning several months the number of coherent signals detected when pure-state filters were used increased by more than a factor of ten compared with unfiltered analysis of the same data. The process is so general in application that it is used regularly in both on-line and off-line analysis of the data. In off-line analysis the efficacy of other signal detection techniques, such as beam-steering and *f-k* analysis, is found substantially improved when the data are pure-filtered prior to the analysis. Paschal, E.W., Helliwell, R.A., **Phase measurements of whistler mode signals from the Siple VLF transmitter,** *Journal of geophysical research,* Mar. 1, 1984 89(A3), p.1667-1674, 14 refs.

A digital signal processing program has been developed to measure the phases of coherent VLF signals from analog tape recordings made in the field. The program uses a constant frequency pilot tone recorded with the VLF data to correct tape speed errors and reconstruct the signal phases. We analyze several examples of whistler mode signals from the VLF transmitter at Siple Station, as received at Roberval, Quebec. Pulses with temporal growth show a relative phase advance with time, and thus a positive frequency offset from the transmitted signal, often from the beginning of the pulse. Amplitude beating is often seen toward the end of a pulse, sometimes with phase cycle-skipping as the emission becomes unlocked from the input signal. Current theories of wave-particle interaction are reviewed and found to explain some of the observed signal features, though no theory predicts the initial frequency offset of a growing pulse. Eather, R.H., **Dayside auroral dynamics,** *Journal of geophysical research,* Mar. 1, 1984 89(A3), p.1695-1700, 10 refs.

Keogram cameras operated at South Pole during 1980 and 1981 have monitored the position, intensity, color, and dynamic behavior of dayside aurora. The position of the midday aurora for very quiet magnetic conditions is some 5 deg further poleward than was previously recognized. The average energy of dayside electron precipitation (about 100 eV) does not change as magnetic activity increases. Rapid latitudinal movements of discrete dayside aurora structures and pulsating structures with Pc 5 periodicities are regularly observed and have no obvious explanation in terms of interplanetary field conditions. Lee, M.C., Kuo, S.P., **Excitation of magnetostatic fluctuations by filamentation of whistlers,** *Journal of geophysical research,* Apr. 1, 1984 89(A4), p.2289-2294, 16 refs.

The thermal filamentation instability of whistlers that can excite magnetostatic and plasma density fluctuations simultaneously has been investigated for cases in the magnetosphere and in the ionosphere. With the available facilities at Siple Station this instability may be excited in the magnetosphere at L = 4 within a few minutes by ducted whistler modes whose frequencies are greater than half the local electron cyclotron frequency. No significant ionospheric effects are expected to be produced by the injected Siple VLF waves. However, marked ionospheric perturbations are predicted with employment of envisioned MF transmitters at frequencies slightly less than the electron cyclotron frequency in the ionosphere. (Auth.)

Salzer, D.T., **L-band satellite communication experiment in the Antarctic** [L-Band-Satellitenkommunikationsexperiment in der Antarktis], *Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt. Forschungsbericht,* Aug. 1982 DFVLR-FB 82-24, 34p., N84-12356/1, In German with English summary. 4 refs.

This report describes a satellite communication experiment performed in 1980 in the Antarctic. A satellite receiving station, installed at the Argentinian antarctic station General Belgrano II was used. The measurement signal was the L-band beacon from the Atlantic Ocean MARISAT Satellite. The elevation angle was approximately 3 deg. The results show unexpectedly high variations of the amplitude of the received signal which strongly influence satellite communications in this antarctic region. Due to the daily and seasonal variations of the amplitude and frequency of the received signal, the ionosphere could be the origin of these effects. (Auth.)

Jones, D., Lefeuvre, F., Parrot, M., **VLF signal recognition by cross-spectral analysis,** *Annales geophysicae,* May/June 1983 1(3), p.253-258, 8 refs.

Considerable effort has been expended in the past in the design of wave experiments to reduce demands on the telemetry link. A major step forward in this direction was the inclusion of a digital correlator in the wave experiment on the GEOS spacecraft, which allowed the on-board computation of auto-correlation and cross-correlation functions. The correlation functions are Fourier transformed on ground to produce spectrograms of good quality which have been widely used in investigations of magnetospheric plasma waves by GEOS 1 and 2. Computer simulations of the correlator's performance prior to flight indicated that certain information in the cross-correlogram could possibly be utilized to great advantage in the recognition of polarized signals, even in the presence of substantial noise. The suggestion entailed the use of the cross-spectral phase, and in particular its stationarity with time, to extract the signal. The technique has now been tested on natural VLF emissions recorded on GEOS 1 and the results are encouraging. The potential of the method for distinguishing signal from noise and for displaying wave propagation characteristics is illustrated using VLF hiss and chorus observed on GEOS 1. (Auth. mod.)

Cahill, L.J., **Observation of an oscillating magnetic field shell at three locations,** *Journal of geophysical research,* May 1, 1984 89(A5), p.2735-2744, 28 refs.

On July 14, 1982, 1830-1930 UT, a complex magnetic pulsation event was observed near the magnetic shell L about 4.5 in the local afternoon. A large magnetic storm was in progress and had proceeded to the early recovery phase. The event began, at 1832 UT, with a sudden decrease in /B/ and a brief, 120-s compressional pulsation. A transverse pulsation then developed with period near 180-s and amplitude about 5 nT. Near 1850 UT this pulsation decreased abruptly and was replaced by a 44-s transverse pulsation. By 1858 UT the 44-s pulsation was fading and a 240-s azimuthal pulsation developed rapidly. It slowly decreased in amplitude after 1910 UT and was gone by 1930 UT. The event was observed at the DE-1 satellite near the equator in both electric and magnetic field components and at the ground magnetic observatories Siple, Antarctica, and Roberval, Quebec, 15 to 30 deg west of DE-1 and at opposite ends of an L = 4.2 field line. Sato, N., **Short-period magnetic pulsations associated with periodic VLF emissions (T about 5.6 s),** *Journal of geophysical research,* May 1, 1984 89(A5), p.2781-2787, 17 refs.

One-to-one correlation between periodic VLF emissions and short-period magnetic pulsations was found at Showa Station on August 8, 1981. The periodic VLF emissions were observed under extremely quiet geomagnetic conditions. Fortunately, the periodic VLF emissions were recorded simultaneously on the ground at Showa and on the ISIS 2 satellite. From the ground data, the intensity of the H component of magnetic pulsations associated with the periodic VLF emissions is about 0.02 nT, approximately 5 times larger than that of the D component of magnetic pulsations. Magnetic pulsations associated with the periodic emissions have constant frequency and show a "linelike" frequency-time spectrum. The amplitude of magnetic pulsations observed at Mizuho Station is approximately one quarter that at Showa. The periodic enhancements of conductivity in the ionospheric D and E regions would modify the current flows in the ionosphere, resulting in the magnetic variations observed on the ground. Sonwalkar, V.S., Bell, T.F., Helliwell, R.A., Inan, U.S., **Direct multiple path magnetospheric propagation: a fundamental property of nonducted VLF waves,** *Journal of geophysical research,* May 1, 1984 89(A5), p.2823-2830, 23 refs.

ISEE 1 satellite observations of nonducted whistler mode signals from the Siple Station VLF transmitter show that all well-defined pulses are elongated by 20 ms to 200 ms. This elongation is attributed to closely spaced multiple paths of propagation between the ground and the satellite. The presence of multiple paths is further confirmed by the observed amplitude fading pattern where fading occurs not only at half the spin period (1.52 s) of the rotating antenna, but also at time scales of the order of 1 s. Electric field measurements show a 2 to 10-dB amplitude variation, which is again consistent with direct multiple path propagation. The results are illustrated with two cases: one on October 29, 1977, inside the plasmapause and the other on May 7, 1979, outside the plasmapause. The results establish that, in general, at any point in the magnetosphere the direct signals transmitted from the ground arrive almost simultaneously along two or more closely spaced direct ray paths. We discuss the implications of our results for nonducted wave-particle interaction in the earth's magnetosphere. (Auth. mod.)

Troshichev, O.A., **Polar magnetic disturbances and field-aligned currents,** *Space science reviews,* 1982 32(3), p.275-360, Refs. p.357-360.

DLC QB1.S77

The results of research of the morphology and physics of polar magnetic disturbances and their relation to three-dimensional magnetospheric currents are reviewed. Magnetic disturbance current systems are examined, as well as their relation to solar wind parameters and magnetic activity level and their seasonal dependence. On the basis of numerical model calculations, it is shown that magnetospheric field-aligned currents observed by the TRIAD and ISIS-2 satellites are the main generation mechanism of high-latitude magnetic disturbances. Plasma pressure gradients are examined as a source of energy for driving field-aligned currents in the closed magnetosphere. (Auth.)

Morrell, C., **Sporadic *E(Es)* associated with the main ionospheric trough observed over Halley Station, Antarctica,** *British Antarctic Survey. Bulletin,* May 1984 No.63, p.1-18, Refs. p.16-18.

The occurrence of sporadic *E (Es)* under the main ionospheric trough is investigated using vertical incidence ionosonde data from Halley Station, Antarctica. This is an ideal location for such studies as the trough is seen over a wide range of magnetic conditions and local times. The study reveals that, before magnetic midnight, *Es* layers with semi-thickness similar to that of the normal day-time *Es* layer are observed most frequently whereas, after midnight, the *Es* layers are ususally much thinner. It is argued that the source of the additional ionization in the *E* region is most likely to be proton precipitation before magnetic midnight but electron precipitation thereafter. A simple method is used to estimate the fluxes and energies of the precipitating charged particles necessary to produce the observed *Es* layers. It is suggested that the observed change in the *Es* layer thickness about midnight is related to the difference in the type and energy spectrum of the precipitating particles. The effects of transport processes in the *E* region are briefly considered but no conclusions drawn concerning them; it is suggested that redistribution of ionization by the convection (dawn-dusk) electric field may be important during disturbed conditions. Roeder, J.L., **Time series analysis of magnetospheric wave-particle interactions,** Houston, University of Houston, 1982, 216p., University Microfilms order No. 83-00739, Ph.D. thesis. Refs. p.203-216.

Whistler mode wave-particle interaction in the earth's magnetosphere was investigated by a sounding rocket experiment performed at Siple Station. The experiment observed intense bursts of X ray bremsstrahlung produced by precipitating electrons. A time series analysis of the observations concluded that the X ray bursts were significantly correlated with the Roberval VLF intensity in the 2-3 kHz frequency range. The experimental results were compared with theoretical predictions of the time delay between the arrival of the VLF emissions at Roberval and the arrival of the precipitating electrons at Siple. Disagreement between the predicted and observed time delays suggested a separation of the wave generation and electron scattering regions. (Auth. mod.)

Tonegawa, Y., Fukunishi, H., **Harmonic structure of Pc 3-5 magnetic pulsations observed at the Syowa-Husafell conjugate pair,** *Journal of geophysical research,* Aug. 1, 1984 89(A8), p.6737-6748, 23 refs.

Strong evidence for the harmonic structure of Pc 3-5 magnetic pulsations observed on the ground has been provided by extracting coherent oscillations from magnetic pulsation data recorded at the Showa-Husafell conjugate pair near L = 6 and then calculating the phase difference of the H components between the conjugate points as a function of local time. The model calculation suggests that the Pc 4/5 band observed in the frequency range 3-10 mHz is the fundamental mode of standing shear Alfvén waves near L = 6, while the Pc 3 band with multiple harmonic structure observed in the frequency range 20-100 mHz is the higher harmonics (usually third to sixth harmonics). The second harmonic is not notable in comparison with other harmonics. It is found further that the fundamental mode and the higher harmonics are not always excited simultaneously. Therefore it is likely that when the frequency of the external driving source is in the Pc 3 range, it excites higher harmonics of standing shear Alfvén waves near L = 6, while when the frequency of the external driving source is in the Pc 4/5 range, it excites the fundamental mode. Smirnova, N.A., **Fine structure of the ground-observed VLF chorus as an indicator of the wave-particle interaction processes in the magnetospheric plasma,** *Planetary and space science,* April 1984 32(4), p.425-438, Refs. p.437-438.

The results of investigations of chorus type VLF emissions in the subauroral conjugate regions using data from Sogra-Kerguelen laboratories and along the meridional profile near the plasmapause projection are summarized in order to connect the peculiarities of ground-observed VLF chorus with plasma processes in the magnetosphere during substorm development. A method of determining the location of the instability region in the magnetosphere is suggested, based on the measurement of the upper boundary frequency and the ground-observed VLF chorus (UBF-method). The dynamics of chorus spectra during the substorm development are investigated. On the basis of the observed regularities a phenomenological model of the development of the VLF chorus source is constructed. Some magnetospheric plasma parameters such as plasma density, large-scale electric field, etc., are calculated. The calculated and typical measured parameters are shown to be conformable. The diagnostic possibilities of VLF chorus are discussed. (Auth.)

Kuwashima, M., Tsunomura, S., Fukunishi, H., **SSC-associated magnetic variations at the geosynchronous altitude,** *Tokyo. National Institute of Polar Research. Memoirs,* July 1984 Special Issue No.31, p.12-26, 38 refs.

SSC events at the geosynchronous altitude have been studied using the data obtained by satellite, and on the ground at Showa Station for the period 1976-1980. In the compressional component (parallel to the ambient magnetic field direction), the SSC amplitude is very large in the noonside, while it becomes smaller with increasing distance from the noonside and is very small or none in the midnightside. In the transverse component (east-west direction), the direction of the initial movement of Psc changes drastically across the noon and the midnight. The direction is eastward in the morningside, while it is westward in the eveningside. (Auth.)

Yamagishi, H., **Auroral zone X-ray pulsations associated with VLF pulsations: B15-3N balloon experiment,** *Tokyo. National Institute of Polar Research. Memoirs,* July 1984 Special Issue No.31, p.124-136, 20 refs.

A stratospheric balloon was launched from Stramsund, Norway, during the recovery phase of a magnetic substorm. The scintillation counter recorded many examples of X-ray microbursts and pulsations at a ceiling altitude of 7 mb (33 km). The ground-based VLF receiver at Andöya, located at 160 km northeast of Stamsund, and at Showa Station, observed polar chorus emissions and quasi-periodic (QP) emissions during the balloon flight. Study of cross correlations between the X-ray and the VLF emissions showed that the X-ray microbursts preceded VLF chorus at Andöya by about 1.7 s, while the VLF chorus at Showa occurred almost simultaneously with the X-ray microbursts. This is qualitatively explained by the nature of counter-streaming type wave-particle interaction and the echoing of whistler mode wave packets in the magnetosphere. X-ray pulsations and rising-tone type QP emissions with periods of 20-30 s showed a good coherency. This similarity suggests that both phenomena are closely related to each other through cyclotron wave-particle interaction in the magnetosphere. (Auth.)

Sato, N., Fukunishi, H., Saemundsson, T., **Operation plan for the Iceland-Syowa conjugate campaign in 1983-1985,** *Tokyo. National Institute of Polar Research. Memoirs,* July 1984 Special Issue No.31, p.169-179, 4 refs.

Geomagnetic conjugate points of Showa, Mizuho and Molodezhnaya stations in Antarctica are located in the vicinity of Husafell, Isafjördur Husavik in Iceland. This campaign aims at a further understanding of physical processes in auroras and their related phenomena from coordinated observations of magnetic field variations, magnetic ULF waves, ELF-VLF emission, cosmic noise absorption and spatial and temporal variations of auroras at these three pairs of geomagnetic conjugate stations. This paper gives an outline of the campaign schedule, the location of three observatories to be set up in Iceland and the specifications of facilities. (Auth.)

Engebretson, M.J., **On the relationship between morning sector irregular magnetic pulsations and field aligned currents,** *Journal of geophysical research,* Mar. 1, 1984 89(A3), p.1602-1612, 29 refs.

Data from search coil magnetometer, riometer, and photometer instrumentation at Siple, Antarctica, are compared with vector magnetometer data from south polar passes of the MAGSAT satellite for three magnetically disturbed days in early 1980. Two kinds of association were found between irregular pulsation activity in the 0.5- to 40-s frequency band (Pi 1) observed on the ground and magnetospheric-ionospheric currents measured from space. These associations are described. These observations support models suggesting that Pi 1 pulsations represent fluctuations of a three-dimensional current system in the magnetosphere and are consistent with recent conductivity and current enhancement models for the ionospheric source of Pi 1 activity. Cazeneuve, H., Tabocchini, H., Piran, M., **Spectral behaviour of disturbances observed in the southern auroral zone,** *Annales de géophysique,* 1982 38(6), p.771-779, With French summary. 12 refs.

Geomagnetic substorms and the associated ionospheric absorption processes are analyzed. Cross-correlation and spectral analysis techniques are applied, in order to unravel the diverse information contained in the original data. Correlation level contours follow systematic variations in the course of each event, which indicates that the coupling between the involved regions is subject to complex and regular variations. The dynamic behavior of the spectral parameters is analyzed. The spectral power and the spectral slopes are found to exhibit recurrent variations that are indicative of a continuous power redistribution. Such ordered variations suggest a continually variable gradient of power, whose effects are felt at Belgrano as the station faces successive disturbance sectors during its daily rotation. (Auth.)

Kane, R.P., **Particle precipitation in the ionospheric F2 region at locations in the vicinity of the South-Atlantic magnetic anomaly,** *Annales de géophysique,* 1982 38(6), p.841-848, With French summary. 22 refs.

The f0F2 daily variation characteristics were compared for IGY equinox months for pairs of stations at roughly similar dip angles, geomagnetic latitudes and L-shell values. It was found that locations on the west coast of South-Africa showed larger f0F2 in the afternoon hours as compared to locations on the east coast of South-America and in the Antarctic. It is suggested that at least a part of this excess may be due to particle precipitation effects in the South-African mid-latitude region. The particles could be either ions or secondary electrons. In low latitudes, Buenos Aires showed larger afternoon f0F2, indicating its probable vicinity to the anomaly region. (Auth.)

Troitskaia, V.A., **Studies on the complex of electromagnetic phenomena in the Antarctic,** Antarctic Committee reports, No.17. Edited by G.A. Avsiuk, New Delhi, Amerind Publishing Co., 1984, p.28-48, TT 79-52012, For Russian original see 10K-21688. 2 refs.

After an introduction reviewing current concepts of magnetospheric structure and dynamics, basic findings of investigations into various disciplines relating to the geomagnetic field and ground currents, aurora, ionospheric radio propagation, and cosmic rays are briefly outlined. New physical phenomena have been discovered in studying this complex of subjects. Special emphasis is laid on the asymmetry in electromagnetic flow processes in the Arctic and Antarctic. Approaches for using available knowledge to study the lower atmosphere and to predict magnetospheric disturbances and radio propagation are suggested. To conclude, the author offers proposals for further research into electromagnetic disciplines. (Auth. mod.)

Men'shutina, I.N., **Behavior of plasma sheet during breakup according to Mirnyy Station data,** Antarctic Committee report, No.17. Edited by G.A. Avsiuk, New Delhi, Amerind Publishing Co., 1984, p.55-59, TT 79-52012, For Russian original see 10K-21690. 15 refs.

Low frequency geomagnetic field pulsations, recorded at high-latitude stations, are proposed as a kind of "instrument" for the study of changes in the thickness of the plasma layer. It is hypothesized that the moment of changeover from thinning to thickening of the layer can be equated with the minimal pulsation period. Data recorded at Mirnyy and Dickson Stations were used to calculate the time lapse between the development of breakup at the zonal station and initiation of plasma layer thickening at $L = 19$. It may be possible to diagnose the plasma layer with low-frequency pulsations, and a series of problems possibly amenable to solution in this way are proposed. (Auth. mod.)

Zaïtseva, N.A., Shliakhov, V.I., **Results of multi-year research on long-wave radiation in the antarctic atmosphere,** Antarctic Committee reports, No.17. Edited by G.A. Avsiuk, New Delhi, Amerind Publishing Co., 1984, p.90-98, TT 79-52012, For Russian original see 10K-29692. 6 refs.

The radiation regime in polar regions has unique characteristics. During the polar night there is no solar radiation and around the clock only low-frequency atmospheric radiation is present. Actinometric soundings were carried out by airplane around Mirnyy from 1958 to 1962 and by radiosonde at Molodezhnaya (1966-1968) and Bellingshausen (1969-1972). Data on vertical distribution of incoming and outgoing radiational heat for the different seasons and under various atmospheric conditions are analyzed. Radiation profile characteristics are determined primarily by the low temperature of the underlying surface and by the extreme clarity of the atmosphere. Radiation patterns differ greatly between the coastal and continental stations, and this is reflected in free atmosphere temperatures at coastal stations. (Auth. mod.)

Gusev, A.M., **Peculiarities of circulation of the antarctic atmosphere and waters of the southern ocean,** Antarctic Committee reports, No.17. Edited by G.A. Avsiuk, New Delhi, Amerind Publishing Co., 1984, p.117-136, TT 79-52012, For Russian original see 10K-21694. 16 refs.

The results of studies of the heat regime and dynamics of the antarctic atmosphere and southern ocean waters are discussed. General circulation charts are constructed, and the physical factors determining air and water circulation patterns, cyclones and eddies are outlined. There are two possible explanations for the formation of cyclonic patterns: wave action or convection. A smoothed mathematical model of large-scale horizontal convection due to global rotation is proposed. The number of eddies in a basin is determined by modelling atmospheric and marine conditions around the Antarctic, and the theoretical locations agree well with field observations. Such models must be constructed first for polar areas, since there the symmetry of processes in relation to geographic coordinates simplifies the issue. Thus Antarctica can serve as a natural model for analogous but more complex situations in the northern hemisphere. (Auth. mod.)

Kunitake, M., Oguti, T., **Spatial-temporal characteristics of flickering spots in flickering auroras,** *Journal of geomagnetism and geoelectricity,* 1984 36(4), p.121-138, 21 refs.

Using video data obtained by a low-light-level TV camera, spatial-temporal characteristics of flickering spots in flickering auroras are studied. The results show that flickering spots often move in periodic fashion synchronized with their luminosity oscillations. For the ex-

mples studied here, the frequency ranges from 3 to 8 Hz; the velocity
f the motion of spots perpendicular to the magnetic field is in a range
om 90 to 240 km/s and the horizontal distance of the motion is in
range 10 to 20 km, being almost equal to the size of a spot. It is
nown that many spots often form a cluster and that many clusters are
istributed along an auroral arc. It is also shown that the lifetime of
certain flickering spot is 1 to 2 seconds and that the lifetime of the
uster is tens of seconds to hundreds of seconds. (Auth.)

udeney, J.R., **Accuracy of simple methods for
etermining the height of the maximum electron
oncentration of the *F2*-layer from scaled ionospheric
naracteristics,** *Journal of atmospheric and terrestrial
iysics,* 1983 45(8-9), p.629-640, 14 refs.

The techniques for estimating *hmF* from *M* (3000)F2 are re-
ewed with particular stress put upon those in which the effects of
derlying ionization are accounted for by a correction. The simpli-
ing assumptions involved in three practical implementations (Brad-
y and Dudeney, 1973; Dudeney, 1974; Bilitza *et al.,* 1979) are
nphasised and their consequences investigated quantitatively using
numerical simulation. The factors considered are the dependence
on *ymF*2, the importance of the underlying layer shape, and the
fluence of the geomagnetic field. It is demonstrated that the cor-
ction technique relies upon *ymF* being a direct polynomial function
*hmF*2. Analysis of observational data suggests that this relation-
ip holds in practice. Fluctuations in *ymF*2 about this mean
riation are shown to produce only small effects which decrease in
agnitude as the amount of underlying ionization increases. It is
monstrated that exclusion of the geomagnetic field introduces a
ry small extra uncertainty dependent upon gyrofrequency and
omagnetic latitude, which decreases as the amount of underlying
iization increases. The three implementations are compared and
s concluded that the Dudeney (1974) scheme gives the best overall
rformance. (Auth.)

odger, A.S., **Spread-*F* ionospheric irregularities and their
lationship to stable auroral red arcs at magnetic mid-
titudes,** *Journal of atmospheric and terrestrial physics,*
84 46(4), p.335-342, 28 refs.

The signature of the stable auroral red arc (SAR arc) as it appears
ionograms is described. The key features are a very significant in-
ase in the amount of spread-*F* and a reduction in the maximum
sma density compared with regions just equatorward and poleward
the SAR arc. Identification of the SAR arc signature is made by
ng complementary data from the global auroral imaging instrument
board the Dynamics Explorer-1 satellite. At sunspot minimum
re is a positive correlation between the occurrence of spread-*F* on
ograms from Argentine Islands, and magnetic activity. In con-
st, at sunspot maximum there is a weak negative correlation when
K magnetic index is less than 6, but a significant increase in spread-
ccurrence at K less than, and equal to 6. Detailed study of iono-
ms shows that there are two distinct regions where considerable
ead-*F* is observed. These are the region where SAR arcs occur and the poleward edge of the mid-latitude ionospheric trough. They are separated by a region associated with the trough minimum, where comparatively little spread-*F* is seen. It is suggested that the movement of these features to lower latitudes with increasing magnetic and solar activity can explain the lack of correspondence between variations of spread-*F* occurrence as a function of magnetic activity at sunspot maximum compared with that at sunspot minimum at Argentine Islands. (Auth.)

Jones, D., Lefeuvre, F., Parrot, M., **Characteristics of VLF emissions manifested by their cross-spectral phase information,** *Planetary and space science,* 1983 31(10), p.1083-1097, 11 refs.

Natural VLF emissions received by a single antenna can be characterized at each point in the emissions' frequency-time domain by a power and a phase. Emissions received at a single point by two antennae with a fixed relative orientation in space can be similarly described by the cross-spectral power and relative phase. It is shown that the cross-spectral phase contains information on the propagation characteristics of the waves which is better utilized in wave analysis than the power. In fact, the phase information allows weak signals to be identified more readily than is possible from a power spectrogram. It also allows the recognition of waves propagating with different wave normal directions. Data from the *Geos*-1 electric and magnetic antennae, pre-processed by the on-board correlator, are used to study the cross-spectral characteristics of VLF hiss and chorus in the Earth's magnetosphere. Lauter, E.A., Bremer, J., Grafe, A., Rössler, H., Schäning, B., **Regular and extreme variations of high latitude ionospheric plasmas in the mesosphere and lower thermosphere** [Reguläre und exzessive Variationen des ionosphärischen Plasmas in der Mesosphäre und unteren Thermosphäre hoher Breiten], *Geodätische und geophysikalische Veröffentlichungen, Reihe 1,* 1984 No.10, p.1-139, In German with English and Russian summaries. Refs. p.99-101.

The paper describes the essential scientific results derived from extensive ionospheric observations made by three German teams during their participation in the 21st, 22nd and 23rd Soviet Antarctic Expedition at the Soviet station Novolazarevskaya. The general aim of this complex antarctic programme was an investigation of precipitating high energy particles (HEP) into the lower ionosphere and their influence on the neutral gas of the mesosphere. Ionospheric absorption measurements at different frequencies, aurora observations with a scanning spectrophotometer, and geomagnetic measurements, mainly carried out between June 1976 and November 1978, together with data from other stations, form the basis for the results obtained. Specific aspects of the investigation are reported. A general description of the geophysical situation at Novolazarevskaya as well as the measuring period and the data used are given. The daily variation of the HEP precipitation is derived for subauroral latitudes. On the basis of detailed discussions of many individual substorm events the connection between auroral emissions at different frequencies, auroral electrojet and ionospheric absorption is analyzed. The influence of the solar wind and interplanetary magnetic field (IMF) on the particle precipitation into the atmosphere is discussed. The connection between ionospheric data of different stations in both hemispheres and geomagnetic data is demonstrated by extensive correlation studies. In annexes, methodical problems of ionospheric absorption measurements in high latitudes and of observations of auroras with a spectrophotometer are discussed in detail. (Auth. mod.)

Bremer, J., Lauter, E.A., Rössler, H., Schäning, B., **Comparison of upper atmosphere particle effects at different latitudes in both hemispheres** [Vergleich hochatmosphärischer Partikeleffekte in verschiedenen Breiten auf beiden Hemisphären], *Geodätische und geophysikalische Veröffentlichungen, Reihe 1,* 1983 No.9, Symposium zur Antarktisforschung der DDR, Garwitz 1982, p.31-37, In German with English and Russian summaries. 9 refs.

On the basis of absorption measurements from 1976 to 1978 at Novolazarevskaya the influence of precipitating high energy particles was investigated on the ionospheric plasma of the meso- and lower thermosphere in subauroral latitudes. It could be shown that the winter anomaly well-known from absorption measurements in middle latitudes also exists in subauroral south latitudes. However, the ionization maxima during equinoxes dominate because of the favorable conditions for the precipitation of high energy particles during these times. By means of absorption measurements in Novolazarevskaya and data from other stations the global character of post storm events (PSE) after strong geomagnetic disturbances could be confirmed. These events, caused by precipitating high energy electrons, last some 15 days and influence the two belts in both hemispheres between the auroral zone and about 40-50 deg geomagnetic latitude depending on the magnitude of the disturbance. Therefore, PSE are the most important direct extraterrestrial influence of long duration upon the atmosphere below 100 km heights so far known. (Auth.)

Grafe, A., **Evening to morning asymmetries of electron precipitation at auroral latitudes** [Abend-Morgen-Asymmetrieeffekt der Elektronenpräzipitation in auroralen Breiten], *Geodätische und geophysikalische Veröffentlichungen, Reihe 1,* 1983 No.9, Symposium zur Antarktisforschung der DDR, Garwitz 1982, p.38-48, In German with English and Russian summaries.

Using observations of the geomagnetic variation field, of ionospheric absorption and of aurorae obtained at Novolazarevskaya during magnetospheric substorms, conclusions are drawn as to differences in electron precipitation in the morning and in the evening sectors. It is shown that the higher energetic electron component (E >100 keV) is often missing in the evening sector whereas it can always be observed in the midnight and morning sector during a substorm. The observed electron spectrum in the morning sector is characterized by significant temporal variations. (Auth.)

Candidi, M., Meng, C.-I., **Nearly simultaneous observations of the conjugate polar cusp regions,** *Planetary and space science,* Jan. 1984 32(1), p.41-46, 16 refs.

The first simultaneous observations of the low altitude polar cusp regions in the conjugate hemispheres are reported based on two events detected by the *DMSP-F* 2 and *F* 4 satellites within the same geomagnetic local time sector. It is found that the electron spectra in the cusp are identical in the opposing hemispheres. In one case the observed latitudinal location and extent of of the cusps are the same at the two hemispheres. However, in the other case the location of the equatorward boundary of the cusp regions differs by about 2 deg with drastically different spatial features. It is also found that in one of the events the plasma sheet electron precipitation regions overlap with the cusp regions at lower latitude in both hemispheres. The poleward boundary of these overlapping regions is located at the same latitude on either hemisphere suggesting that this is the latitude of the last closed field line and that the cusp electrons are present on both closed and open magnetic field lines. McKibben, B.N., **Atmospheric infrasound from volcanic eruptions in 1982,** *Antarctic journal of the United States,* 1983 18(5), p.257-259, 3 refs.

Observations of atmospheric infrasonic waves have been made at Windless Bight near McMurdo Station since 1976. Through the 1982 austral winter season, computer software was developed to facilitate the retrieval and analysis of the data collected. This software package includes time-domain analysis, spectral analysis, frequency-wavenumber (f-k) analysis, pure-state filtering, beam-steer vector filtering, and rudimentary graphics. A method was also developed for transmitting analysis results and diagrams to Fairbanks, Alaska. Infrasonic waves produced by four explosive eruptions of El Chichonal Volcano in Mexico and one eruption of Galunggung in Java were observed at Windless Bight in 1982. Time domain analysis results are given for signals from all of the eruptions recorded traveling in the direct great circle path from the source to Windless Bight and for signals from two of the eruptions traveling in the antipodal path. The data include event time, travel time, velocity, azimuth of arrival and energy release estimates.

Detrick, D.L., Rosenberg, T.J., Lanzerotti, L.J., MacLennan, C.G., **Riometry in Antarctica,** *Antarctic journal of the United States,* 1983 18(5), p.259-260, 3 refs.

As part of the expanding facilities for upper atmospheric physics research at South Pole and McMurdo Stations, the University of Maryland installed a digital data acquisition system at both stations during the 1981-1982 austral summer season. In the 1982-1983 summer season, an identical system was installed at Siple Station, and a 30 MHz riometer was placed at Palmer Station. The data acquisition systems now operating at all stations (except Palmer) are designed to digitize and record analog signals at any one of three fixed sampling rates: 10, 1, or 0.1 Hz. The University of Maryland riometers (Siple: 30 MHz; McMurdo: 30 and 51.4 MHz; South Pole: 20.5, 30, and 51.4 MHz) are sampled at the 1-Hz rate. In addition, at Siple and South Pole Stations, magnetic (1 Hz; 10 Hz), very-low-frequency emission (1 Hz), and auroral intensity (1 Hz) variations are recorded at the indicated sampling rates. Data from a pre-midnight absorption event at South Pole Station and a band-pass filtered 30 MHz riometer signal at McMurdo Station are examined to demonstrate the importance of simultaneous digital recording of complementary signals.

K-30947

Pomerantz, M.A., **Cosmic ray intensity variations,** *Antarctic journal of the United States,* 1983 18(5), p.261-262, 1 ref.

Investigations of a ground-level enhancement (GLE) solar flare event occurring on Dec. 7, 1982 and observed at three Bartol antarctic stations have yielded some puzzling characteristics. Further, the first of a series of investigations using an underground cosmic ray detection system at Mawson Station has also yielded an unexpected result. A comparison of the data recorded during a long highly disturbed period from June to November 1982 revealed significant differences in the intensity vs. time profiles of the McMurdo Station neutron monitor (mean rigidity of response about 9 GV) and a new underground telescope at Mawson (mean rigidity of response about 180 GV). Preliminary analysis, which also involves observations by a multi-directional surface telescope at Nagoya, Japan has led to the conclusion that the effect is produced by the superposition of a north-south anisotropy and a worldwide Forbush decrease.

Arnoldy, R.L., Cahill, L.J., Jr., **Magnetic pulsation activity at South Pole Station,** *Antarctic journal of the United States,* 1983 18(5), p.265-266, 3 refs.

The year 1982 was the first year of continuous digital recording of geomagnetic pulsations at the South Pole from the University of New Hampshire/University of Minnesota induction antennas. A first attempt was made to characterize the pulsation activity at the South Pole by defining an activity index. This index is the averaged amplitude of the high-pass filtered data from the x-axis antenna. The filter edge is set a 0.1 hertz, hence the index includes Pi 1, Pc 1, and Pc 2 pulsations. Hours in which the activity index exceeded 0.2 were recorded for the first 147 days of 1982. Plots of the data are shown and briefly discussed. The geophysical significance of the data must await more detailed analysis and correlation with other south polar measurements.

Pomerantz, M.A., **Solar seismology at the South Pole: Studies of solar oscillations,** *Antarctic journal of the United States,* 1983 18(5), p.266-267, 1 ref.

Work is continuing on extracting new information from the unique data set acquired during the first campaign of the full-disk Doppler-shift experiment conducted during the 1979-80 austral summer in collaboration with French researchers. During the past year, a new concept for conducting solar observations at the South Pole was designed, developed, and successfully tested in the field. The original vertical telescope has been replaced by a superior and simpler system which has eliminated all of the problems inherent in the original arrangement. A drastically improved full-disk experimental package constructed by the French developed problems requiring that the system be redesigned. Experiments with a wind-fence designed to reduce the wind speed at the instrument yielded dramatic results.

Stebbins, R., Mann, R., **Observations of solar oscillations at the South Pole,** *Antarctic journal of the United States,* 1983 18(5), p.268-269, 2 refs.

The internal properties of the Sun can be deduced from the star's acoustic normal mode spectrum. A telescope designed to measure brightness oscillations of the Sun was operated at the Amundsen-Scott South Pole Station throughout the austral summer of 1982-1983. The equipment performed very well, and an unusually large amount of data was obtained. Over 600 hours of data were acquired, the longest unbroken set being 115 hours. The data reduction procedure, which is in progress, and subsequent analysis are summarized.

Carlson, C.R., **Siple 21- and 42-kilometer antennas: Measurement and performance,** *Antarctic journal of the United States,* 1983 18(5), p.270-272, 4 refs.

This paper gives the performance of the 21-kilometer-long and 42-kilometer-long very-low-frequency (VLF) dipole antennas in operation at Siple Station, Antarctica. Extension of the existing 21-kilometer center-fed dipole antenna to 42-kilometer was completed during the 1982-1983 austral summer. The measurement procedure and antenna construction are illustrated; the current in the 42-kilometer antenna and the voltage between the antenna and the support tower are plotted for the frequency, 7.75 kilohertz; the electrical properties of the antennas are tabulated at the various resonant frequencies.

Bell, T.F., Katsufrakis, J.P., James, H.G., **Studies of the spectral broadening effect with the Siple Station VLF transmitter,** *Antarctic journal of the United States,* 1983 18(5), p.272-274, 6 refs.

In the past, data acquired on both high- and low-altitude satellites have indicated that most important VLF wave-particle interactions took place at high altitudes close to the magnetic equatorial plane. However, recent low-altitude VLF wave-injection experiments involving the Siple Station VLF transmitter, the Omega navigational transmitter in North Dakota, and the three satellites ISIS-I (Canada), ISIS-II (Canada), and ISEE-1 (United States) have demonstrated the existence of a new phenomenon in which initially narrowband (approximately 1 hertz) signals from ground-based VLF transmitters undergo a significant frequency bandwidth increase as they propagate through regions where energetic electron precipitation is thought to take place. Examples of the spectral broadening effect as observed on the ISIS-I and -II satellites are shown and described. It is demonstrated that upward and downward propagating signals can exhibit spectral broadening at the same time.

Brittain, R., Kintner, P.M., **Observations of standing waves in VLF hiss over Siple Station,** *Antarctic journal of the United States,* 1983 18(5), p.275-277, 4 refs.

Very low frequency (VLF) electric and magnetic field experiments were flown on sounding rockets Nike-Tomahawk 18.203-205 from Siple Station during December 1980-January 1981. Observations were made of systematic patterns in naturally occurring VLF hiss, which were not observed simultaneously on the ground at Siple. These patterns have been interpreted as standing waves formed by interference between downcoming waves and waves reflected from a sharp layer in the ionosphere at about 90 km. Deductions are drawn concerning the refractive index of the medium for such waves and these are supported by independent measurements.

Helliwell, R.A., **Siple Station VLF two-frequency squelch experiments,** *Antarctic journal of the United States,* 1983 18(5), p.277-278, 7 refs.

A new transmitter with AM and FM capability was placed in operation at Siple Station in 1979 to replace the smaller, less flexible Zeus transmitter. The purpose of this article is to describe a new Jupiter experiment in which two equal-amplitude signals at frequencies f1 and f2 were observed to squelch one another when f2-f1 equals approximately 20 hertz. These new experiments extend earlier results obtained using the limited FM capability of the Zeus transmitter. Examples of the transmitted and received signal spectra are shown along with the average amplitude of the received signal.

Cahill, L.J., Jr., Sugiura, M., Arnoldy, R.L., Engebretson, M.E., **Conjugate magnetic pulsation studies at Siple, Roberval, and DE-1,** *Antarctic journal of the United States,* 1983 18(5), p.279-281, 4 refs.

A magnetic pulsation event occurring on July 14, 1982 at a time when the Dynamics Explorer-1 (DE-1) satellite was in approximate magnetic conjugacy with Siple Station and Roberval, Quebec is illustrated and described. The observations at the three sites support the idea of the waves as a resonant oscillation of magnetic field lines. The relatively weaker amplitude at Siple may be due to low conductivity in the dark winter ionosphere at Siple in July. Oscillating ionospheric E region currents, set in motion by the field line resonance, are thought to be responsible for the pulsations observed on the ground. The sunlit ionosphere at Roberval should have sufficient conductivity to allow substantial oscillating currents while the low conductivity at Siple decreased the current amplitude and thus the ground pulsations.

Armstrong, W.C., **Recent advances from studies of the Trimpi effect,** *Antarctic journal of the United States,* 1983 18(5), p.281-283, 15 refs.

Progress made since 1963 with a method designed to study the possible effect of vertical transport of charge upward into the ionosphere above a thundercloud is reviewed. The technique consists of continuous monitoring of radio signals propagating in the Earth-ionosphere waveguide and reproduction of the signals for laboratory study, using a system which is optimized to reject noise to the extent necessary to pass the particular ionospheric transients being sought. Results based on data recorded on Oct. 25, 1980, during a period of severe storm conditions indicate the possibility of significant amounts of transferred charge and show accompanying whistlers and sferics with unusually strong ELF components. A sample recording (Annapolis, MD-Siple Station, Antarctica) which seems to imply a direct effect of lightning on the ionosphere, is presented.

K-30958

Gail, W.B., **Suppression of natural VLF noise by whistlers,** *Antarctic journal of the United States,* 1983 18(5), p.283-285, 3 refs.

A recent analysis of data from South Pole, Palmer and Byrd Stations as well as Siple has revealed that noise suppression by whistlers is far more common than previously suspected. Data acquired at South Pole during 1981 showed suppression events on 20% of all winter days; similar events have now been identified on 5% of all days at Siple during 1977, 1978, and 1980. The evidence indicates that whistlers interact with the particles that are believed to produce natural VLF noise. Events observed at Siple on July 24, 1977 not only provide support for the wave/particle interaction model, but also suggest that suppression may be a driving mechanism for particle loss from the magnetosphere. It is possible that suppression events are a natural analog to the quiet-band effect, in which portions of noise bands were found to be attenuated by Siple transmitter signals.

Carpenter, D.L., Katsufrakis, J.P., Trimpi, M.L., Dermedziew, M., **Whistler-induced perturbations of broadcast band signals,** *Antarctic journal of the United States,* 1983 18(5), p.285-286, 3 refs.

The occurrence of a Trimpi event typically appears to a field observer as a fast change in the level of a signal at the time of reception of a lightning-induced whistler. Recent research based on observations at Palmer and Siple Stations has provided evidence that the size of the subionospheric change is proportional to the amplitude of the correlated whistler. A current observational program at Siple and Palmer is devoted to study of Trimpi effects at frequencies in the low- and medium-frequency bands from approx 30 kHz to approx 1 MHz. Of particular interest is the fact that well-defined perturbations have also been seen on 780 and 800-kHz signals originating in South America. Two examples are presented: 1) perturbations recorded at Palmer on subionospheric signals ranging in frequency from 12.9 kHz to 780 kHz, and 2) Palmer Station records showing a correlation between whistlers and several strong perturbations in a 780-kHz signal.

Ranta, H., Ranta, A., Rosenberg, T.J., **Day to night absorption ratio in auroral and subauroral zone riometer measurements during auroral absorption,** *Journal of atmospheric and terrestrial physics,* May 1984 46(5), p.395-398, 9 refs.

The day to night ratio of auroral absorption has been studied using data from auroral and subauroral latitudes and by application of different kinds of statistical analyses. Ratios between 0.5 and 3.0 are obtained, depending on the criteria applied to the selection of data. Previous studies obtained similar ratios, but reached different conclusions about the effective solar control of auroral absorption. It is concluded that evidence of solar control of the day to night ratio of auroral absorption, or the lack thereof, cannot be extracted by these statistical analyses. (Auth.)

Crowley, G., Dudeney, J.R., Rodger, A.S., Jones, T.B., **Large simultaneous disturbances (LSDs) in the antarctic ionosphere,** *Journal of atmospheric and terrestrial physics,* Oct 1984 46(10), p.917-925, 42 refs.

A high frequency radio Doppler experiment was deployed in the Antarctic Peninsula region, centered on Argentine Islands to investigate the morphology and sources of ionospheric disturbances. The experiment consisted of a three-transmitter dual frequency network which permits horizontal and vertical propagation velocities to be estimated over a north-south baseline of 200 km and an east-west baseline of 100 km. A new class of ionospheric disturbance has been observed, in the period range 10 min-1 h. These disturbances are characterized by unusually good correlation between perturbations on all available Doppler signals, but are apparently non-propagating and occur simultaneously at each reflection point. Criteria for identification of LSDs are established and the analysis of one event is described in detail. The occurrence statistics of the LSDs are presented, including their seasonal and diurnal distributions. There is no clear general relationship between LSDs and local geomagnetic field perturbations. However, there is a loose association between the occurrence and amplitude of LSDs and magnetic activity. (Auth. mod.)

Rash, J.P.S., Gledhill, J.A., **Electron density profiles over the southern ocean from oblique incidence ionograms,** *Journal of atmospheric and terrestrial physics,* Oct. 1984 46(10), p.945-951, 15 refs.

This paper presents a first attempt to use oblique incidence ionograms over the 4500 km path from SANAE to Grahamstown, South Africa, to deduce information about the ionosphere in the intervening regions. It is shown that existing methods for the reduction of oblique incidence ionograms to *N(h)* profiles give reasonable results even over the two-hop path involved. By comparison with vertical incidence ionograms made from a research ship below the reflection regions it is shown that the maximum observed frequency is normally limited by conditions at the southernmost reflection point, though this may be modified by ionospheric tilts, sunrise and sunset. Hughes, W.J., Singer, H.J., **Mid-latitude Pi 2 pulsations, geosynchronous substorm onset signatures and auroral zone currents on March 22, 1979: CDAW 6,** *Journal of geophysical research,* Feb. 1, 1985 90(A2), p.1297-1304, 16 refs.

The mid-latitude Pi 2 pulsation signatures observed using the Air Force Geophysics Laboratory Magnetometer Network during the March 22, 1979, Sixth Coordinated Data Analysis Workshop interval are related to the magnetic variations observed at geosynchronous orbit and to ionospheric current distributions derived from high latitude (Halley) magnetometer data and an ionospheric conductivity model. It is shown that at least three separate substorm onsets or intensifications occurred around 1100 UT, specifically at 1053:50, 1104:10 and 1110:30 UT. An earlier onset which occurred at 0614 UT during a geomagnetically quiet interval is contrasted to these more disturbed events. In both cases the Pi 2 polarization pattern locates the region of strong westward electrojet. Changes in the Pi 2 polarization during a single event appear to accompany small shifts in the electrojet position. These events do not obey the Pi 2 period-electrojet latitude relationship obtained by Kuwashima and Saito (1981). (Auth.)

Carlson, C.R., Helliwell, R.A., Carpenter, D.L., **Variable frequency VLF signals in the magnetosphere: associated phenomena and plasma diagnostics,** *Journal of geophysical research,* Feb. 1, 1985 90(A2), p.1507-1521, Refs. p.1520-1521.

Coherent variable frequency signals (ramps) extending from 1 to 8 kHz, injected into the magnetosphere from Siple Station, Antarctica exhibit upper and lower cutoffs when received at the conjugate station, Roberval, Quebec. Ramp group delay measurements and ionospheric sounding data are used for the first time to determine the cold plasma density and L shell of the propagation path. Observed upper cutoff characteristics are interpreted in terms of off-equatorial gyroresonant interaction regions and ducted propagation limited to frequencies below half the local gyrofrequency. The observed lower cutoff frequencies varied systematically with transmitted ramp slope, suggesting a threshold in the resonant electron number density above which rapid temporal wave growth and saturation can occur. This concept is used to develop a hot plasma diagnostic technique which provides an estimate of the energy dependence *n.* A test of this technique is given using the data and a simplified wave-particle interaction simulation. Additional aspects of the magnetospheric response to ramp injection, including emission triggering, are discussed.

Eather, R.H., **Polar cusp dynamics,** *Journal of geophysical research,* Feb. 1, 1985 90(A2), p.1569-1576, 14 refs.

The position of dayside aurora (as measured from South Pole Station in 1980) is compared with the interplanetary magnetic field Bz component and to the AE index. The results are consistent with earlier work showing a close relationship with AE and little correlation with Bz. Two recent papers have presented data that were interpreted to indicate a dominant Bz correlation. A reconsideration of the data sets used in those papers does not support dominant Bz dependence, and in fact reaffirms a close dependence on AE. It is concluded that the position of the dayside cusp is largely controlled by substorm processes internal to the magnetosphere rather than by direct merging and erosion processes with the interplanetary field. Hajkowicz, L.A., **Onset time interval of geomagnetic disturbances in the conjugate areas,** *Planetary and space science,* July 1984 32(7), p.819-823, 20 refs.

The onset time interval of geomagnetic disturbances, as deduced from the numerous cases of rapid changes of K-indices over a cycle in solar activity, was studied for two conjugate and auroral stations, Macquarie Island and College. There is a distinct peak in the occurrence number of the disturbances for both stations at an interval 09.00-12.00 U.T., which is close to the local midnight at College but is in the pre-midnight sector at Macquarie Island. For comparison, a similar study was applied to the magnetic data obtained at two more auroral stations, Kiruna and Sodankyla. The onset time of the disturbances for these stations was most frequent at 18.00-21.00 U.T., centered at the conjugate midnight of Kiruna and Sodankyla in the Southern Hemisphere but well ahead of the local midnight of the stations themselves. The specific diurnal occurrences of the disturbances at all four auroral stations are consistent with a difference in the geometry between the southern and northern auroral ovals. It appears that the prevailing onset time of geomagnetic disturbances is associated with the time when both conjugate stations (or conjugate locations) are within the auroral oval and thus accessible to a direct particle influx from the Earth's magnetotail. Morris, R.J., Cole, K.D., **Pc1-2 discrete regular daytime pulsation bursts at high latitudes,** *Planetary and space science,* Jan. 1985 33(1), p.53-67, 22 refs.

A family of related Pc1-2 (0.2-10 s) discrete daytime geomagnetic pulsations is presented using pulsation data obtained at Davis, Antarctica, a typical polar-cap station. The morphological properties of IPRP and Pc1b pulsation regimes, which maximize in amplitude and frequency of occurrence under the projection of the polar cusp, are examined. Furthermore, two other variations of discrete pulsation bursts yet to be named are also presented, viz IPFP (Intervals of Pulsations with Falling Period) and IPAP (Intervals of Pulsations with Alternating Period) which are observed on rare occasions. It is also suggested that the Pc1b (0.2-5 s) should be extended to incorporate Pc2b (5-10 s) which from the results in this paper are physically the same phenomenon and could be collectively classified as IPCP (Intervals of Pulsations with Constant Period). Sato, N., Hayashi, K., **Band-limited ELF emission burst (auroral roar),** *Journal of geophysical research,* Apr. 1, 1985 90(A4), p.3531-3535, 15 refs.

A new type band-limited ELF emission burst which is closely associated with impulsive auroral hiss and auroral breakup is identified on the ground at Showa Station. The ELF emissions have a center frequency of 100-350 Hz and a duration of 10-150 s, in which band-limited structures are found in frequency-time displays. In many cases the band-limited structures show falling tone with time. Most of the emissions are observed at the onset of the substorm expansion phase for the limited magnetic local time of 1700-2400 MLT and in the austral winter season of June-August. The new band-limited ELF emission burst is termed "ELF auroral roar" because it is observed with a roaring sound through an audio speaker. (Auth.)

Fukunishi, H., Kokubun, S., Matsuura, N., **Aurora and polar upper atmosphere** [Orora to cho koso taiki], Nankyoku no kajaku (Science in Antarctica) Vol.2, Tokyo, National Institute of Polar Research, 1983, 325p., In Japanese. Refs. p.308-320.

The history of 25 years of Japanese upper atmosphere studies at Showa and Mizuho stations and general knowledge on auroras and upper atmosphere physics is outlined. Chapter 1 is an introduction into the nature of auroras and related magnetic and electric phenomena, and into the various methods of observation and instruments. Chapter 2 discusses the forms of auroras as observed both from earth and from space, and deals with high-speed charged particles, their interaction with magnetic fields and their role in the formation of auroras. Changes of auroral forms in time and space are also treated in this chapter. Chapter 3 describes various types of plasma waves, their alignment with magnetic fields of force, and interaction with auroral particles. Chapter 4 takes up the formation and structure of the polar ionosphere, ionospheric and magnetic disturbances, and the energy transfer between magnetosphere and ionosphere. Special conditions in the Antarctic, which require particular precautions and sophisticated methods of observation are touched upon. The bibliography of some 370 items refers mostly to english-language titles, primarily by Japanese and American authors, and some Japanese citations.

Rastani, K., Inan, U.S., Helliwell, R.A., **DE 1 observations of Siple transmitter signals and associated sidebands,** *Journal of geophysical research,* May 1, 1985 90(A5), p.4128-4140, 19 refs.

VLF signals from the Siple Station transmitter received on the DE 1 spacecraft provide new information on whistler mode signal propagation paths in the magnetosphere. In two case studies, the measured group delay in conjunction with in situ density measurements and ray tracing analysis are used to distinguish between direct nonducted propagation and a hybrid mode consisting of one-hop propagation in a duct followed after ionospheric reflection by nonducted propagation. The extent of the observations both in space and time indicates that such a hybrid propagation mode may be an important means by which whistler mode signals generated or amplified in ducts can populate the magnetosphere. Computed group time delays based on a diffusive equilibrium model for the density distribution along the field lines provide good agreement with measurements over a wide range of magnetic latitudes. In one case, observed Siple signals are associated with sidebands of 30Hz spacing, and emissions are occasionally triggered. Sidebands are associated with signal components that are believed to have propagated on direct nonducted paths as well as in a hybrid (ducted/nonducted) mode with the sideband spacing being equal in both cases. The sideband spacing is found to be independent of the carrier frequency and amplitude and the satellite location with respect to the magnetic equator. (Auth.)

Carpenter, D.L., Inan, U.S., Paschal, E.W., **New VLF method for studying burst precipitation near the plasmapause,** *Journal of geophysical research,* May 1, 1985 90(A5), p.4383-4388, 19 refs.

VLF signals in the 2-4 kHz range transmitted from Siple Station, and received at various antarctic locations have been used to detect the occurrence of burst precipitation of electrons into the nighttime lower ionosphere. The receiving stations, each about 1460 km from Siple, were located to the north at Palmer, to the east at Halley and to the south at South Pole. Rapid changes in the received phase and amplitude of the Siple signal ("Trimpi events") were observed in conjunction with the reception of one-hop whistlers. In one case involving propagation paths lying poleward of the plasmapause, amplitude decreases by 20% in 2 s, decaying in 7 s, were recorded simultaneously at Halley and South Pole. In a case of phase perturbations at Palmer, the Siple signal path crossed the plasmapause projection, and the associated whistlers propagated in the outer plasmasphere. Phase measurements appear to be a particularly sensitive means of detecting burst precipitation activity under experimental conditions of the kind described. The length and spatial distribution of the signal paths provide a basis for studying the occurrence and approximate location of burst precipitation in regions outside the observing range of most instruments used for detection of precipitation. Direction finding on correlated whistler events as well as dispersion analysis may be used to increase the spatial resolution of the method. (Auth.)

Kaminuma, K., Ito, K., **Ground tilt observations at Showa Station, Antarctica Part 1. Borehole tiltmeter,** *Tokyo. National Institute of Polar Research. Memoirs,* Oct. 1983 Special issue No.28, Symposium on Antarctic Geosciences, 3rd, 1982, Proceedings, p.27-32, 4 refs.

This paper discusses borehole tiltmeter data from April to December 1981. The signals were recorded on a 12-channel chart recorder in the data processing hut, 150 m north from the observation hole. The maximum tilt fluctuation during nine months was 17 microrad in the X-component (E-W) and 24 microrad in the Y-component (N-S). Observed data were corrected for temperature assuming a linear relation between the ground tilt and the underground temperature. The cumulative change of ground tilt during nine months of observation was -1.5 microrad in the X-component and 6 microrad in the Y-component. These observations demonstrate that a true ground tilt can be detected by the borehole tiltmeter. (Auth. mod.)

Kaminuma, K., Nagao, T., **Ground tilt observations at Showa Station, Antarctica Part 2. Water-tube tiltmeter,** *Tokyo. National Institute of Polar Research. Memoirs,* Oct. 1983 Special issue No.28, Symposium on Antarctic Geosciences, 3rd, 1982, Proceedings, p.33-41, 4 refs.

To observe the secular change of ground tilt in response to deglaciation in Antarctica, a water-tube tiltmeter was installed at Showa Station, in the snow-free area without a vault. The tiltmeter adopted is a moving float type using antifreeze as the fluid and consists of four detectors which measure two tilt components. The detectors were covered with wooden boxes and the water-tubes were covered by airtight polyvinyl chloride tubes. Observations began in April 1981. The records were strongly affected by air temperature and solar radiation. In spite of several problems, ground tilt observation by means of water-tube tiltmeters was possible in the Antarctic region, even if there was no vault for installing the equipment. (Auth.)

DLC QE357.A57 1983

Palaeomagnetic measurements on material from radiometrically dated rock complexes from the following locations in northern Victoria Land are presented: (a) Devonian-Carboniferous granites of the Yule Bay area (b) Ferrar Dolerites from Litell Rocks with apparent ages ranging from 90-120 Ma (c) Upper Miocene volcanics from the Hallett Group. Samples collected during the West German Ganovex I and II expeditions were analysed with the aid of AF and thermal demagnetisation techniques. Evaluation of the Devonian-Carboniferous samples from five sites yielded in four cases a mean magnetisation direction with high inclination values, inferring a near pole position of northern Victoria Land at the time. Measurements on samples from one site gave a palaeomagnetic pole position at 46.5 S, 7.6 E. From the Cretaceous dolerites a palaeomagnetic pole at 76.9 S, 201 E based on the mean magnetisation direction of three sites was obtained. Upper Tertiary volcanics from ten sites on Adare Peninsula and four sites from Hallett Peninsula were analysed. The Adare sites yielded a palaeomagnetic pole position at 83.6 S and 186.4 E, the Hallett sites a pole position at 81.9 S and 256.8 E. By combining the Hallett Group data with the mean direction of the Cape Hallett lavas, a mean palaeomagnetic pole position at 89.4 S and 120 E is obtained. This result can be interpreted to imply a geologically younger age for the volcanics of Hallett Peninsula than that of the Adare Peninsula basalts. (Auth.)

Jankowski, E.J., Drewry, D.J., Behrendt, J.C., **Magnetic studies of upper crustal structure in West Antarctica and the boundary with East Antarctica,** Antarctic earth science; fourth international symposium. Edited by R.L. Oliver, P.R. James and J.B. Jago, Cambridge University Press, 1983, p.197-203, 29 refs.

DLC QE357.A57 1983

The subglacial structure and geology of West Antarctica is poorly known, yet important to the understanding of the tectonic evolution of Gondwanaland. Simultaneous Radio Echo Sounding (RES) and magnetic data have been collected over West Antarctica. Estimates of maximum depth to magnetic basement were made using an automatic computer method and selected anomalies modeled using a two dimensional inversion programme. These studies were combined with subglacial topographic information, derived from ReS, and all pertinent geological and geophysical measurements to suggest interpretations of subglacial geology. Shallow magnetic basement is associated with volcanic outcrop in northern Marie Byrd Land. Basement deepens below the Byrd Subglacial Basin where volcanics are believed to lie beneath a variable, but thin, cover of Mesozoic-Cenozoic sediments. Asinuous ridge cutting the basin is also believed to be of volcanic origin and probably related to Marie Byrd Land volcanics. The boundary relationships between East and West Antarctica are complex. Previous suggestions of a major fault separating the two are supported by the abrupt boundary visible in RES records in the vicinity of the Horlick Mountains. Identification of their boundary becomes more problematic towards the Thiel Mountains. Limited geological information and the results of this study suggest that the boundary zone probably passes close to the Thiel Mountains in the area between them and the Stewart Hills, Hart Hills and Pagano Nunatak. McGinnis, L.D., Wilson, D.D., Burdelik, W.J., Larson, T.H., **Crust and upper mantle study of McMurdo Sound,** Antarctic earth science; fourth international symposium. Edited by R.L. Oliver, P.R. James and J.B. Jago, Cambridge University Press, 1983, p.204-208, 19 refs.

DLC QE357.A57 1983

Crustal thickness is the fundamental distinguishing characteristic between East and West Antarctica. The boundary between the two is located 15 km offshore in McMurdo Sound. The Sound is underlain by as much as 3.5 km of glaciomarine and preglacial sediments resting upon a crystalline basement identical to that in the dry valleys. Basement is underlain, at depths up to six kilometres, by a nonmagnetic seismic refractor having a velocity near 6.5 km/s. The refractor is believed to consist of granulitic facies, petrologically similar to inclusions found on Hut Point Peninsula. A "preliminary" depth to the mantle is 25 km under western McMurdo Sound. From gravity data it is shown that the mantle descends abruptly from a depth of 25 km at a point 15 km offshore to a depth over 35 km beneath the Strand Moraine. Ignoring the overlying sediments and water depth, crustal thickness increases from about 21 km beneath McMurdo Sound to over 40 km beneath the Transantarctic Mountains. It is assumed that the change in crustal thickness occurred during the Ross Orogeny, one of a series of Early Palaeozoic orogenic epochs that created the boundary between East and West Antarctica. The orogenies were episodes of collision between two plates 20 to 25 km thick, comparable to crustal thicknesses associated with present, passive continental margins. All subsequent tectonic events along the Transantarctic Mountains occurred along the boundary of convergence, a consequence of crustal thickening. Complex modification of West Antarctica and the belt of convergence has continued since the Early Palaeozoic orogenies; however, the integrity of the presently remaining core of East Antarctica has not been seriously compromised since cratonisation.

Stagg, H.M.J., Ramsay, D.C., Whitworth, R., **Recent BMR magnetic surveys of the southeast Indian Ocean,** Antarctic earth science; fourth international symposium. Edited by R.L. Oliver, P.R. James and J.B. Jago, Cambridge University Press, 1983, p.384-386, 11 refs.

DLC QE350.A57 1983

To mid-1982, a total of approximately 110,000 km of good quality data has been acquired in the area between Melbourne and Hobart and the Australian Antarctic bases of Mawson and Davis. The relative positions of southeast Australia and the Mawson-Davis area have forced a generally northeast-southwest orientation on the *Nella Dan* tracks, oblique to the majority of previous ships tracks. Early indications are that this new direction will allow a more accurate delineation of the locations, trends and frequency of fracture zones and transform faults. Most of the lines proceed closer to the Antarctic margin than earlier data; this should allow better definition of the presently poorly defined anomalies close to Antarctica. Tracks into and out of Mawson are providing a gradual improvement in the magnetic coverage of the Enderby Basin between Enderby Land and the Gaussberg Ridge. It is hoped that data on these tracks will help elucidate the spreading history of this largely unknown area. As a result of the surveys it may be possible to make a revised estimate of the secular variation of the Earth's magnetic field, by comparing magnetic values at line intersections of *Nella Dan* and earlier surveys (principally *Eltanin).* This should lead to a refined version of the Australian Geomagnetic Reference Field, a local improvement to the IGRF in an area where it has been found inadequate. Bentley, C.R., **Crustal structure of Antarctica from geophysical evidence—a review,** Antarctic earth science; fourth international symposium. Edited by R.L. Oliver, P.R. James and J.B. Jago, Cambridge University Press, 1983, p.491-497, 40 refs.

DLC QE350.A57 1983

Where measured in East Antarctica the thickness of the layer overlying the basement complex is mostly less than half a kilometer, and the crust is about 40 km thick. In West Antarctica, the basement complex typically lies 2 or 3 km below the ice and the crust is only 25 to 30 km thick. Gravity measurements show that the crustal transition is abrupt across the Transantarctic Mountain front. Earlier seismic surface wave studies indicated a "typical continental" structure for East Antarctica; more recent measurements along a somewhat different section suggest a typical Precambrian shield. Scanty body-wave evidence on the upper mantle structure beneath East Antarctica also shows typical sub-shield characteristics. In West Antarctica, the crust under the Ross Sea embayment, Byrd Subglacial Basin and Weddell Sea embayment is probably only about 25 km thick. The thick sediments, thin crust, and positive gravity belt in the Ross Sea embayment suggest that it may be a rift zone. Gravity anomalies measured on the Ross Ice Shelf, supported by some seismic refraction measurements of sediment thickness, suggest deep structural control of the submarine and subglacial ridge/trough topography, which could reflect a horst-and-graben structure. That structure disappears abruptly under central West Antarctica, but high seismic velocities typical of deep continental or oceanic crust do occur at shallow depths. Continental palaeomagnetic data suggest at least three microplates in West Antarctica, all separate from East Antarctica. (Auth.)

DLC QE350.A57 1983

The principal features of Antarctic crustal structure are derived from an analysis of three major crustal surfaces whose regional characteristics are obtained from available reconnaissance data, viz. the bedrock surface, the "magnetic" basement surface and the Moho. The relief of the two former surfaces is broadly comparable and indicates the abundance of linear neotectonic features such as rifts/grabens which group into transcontinental systems and are clearly reflected in the behavior of the Moho and Conrad interfaces. The "magnetic" basement of cratonic terrains and sedimentary basins is believed to consist mainly of Lower Precambrian crystalline basement rocks overlain by upper Precambrian to Lower Palaeozoic sequences whereas in orogenic areas it probably includes both the remobilised ancient infrastructure and surrounding Phanerozoic complexes. Crustal profiles for selected areas are compiled on the basis of integrated interpretations of gravimetric, magnetic and seismic data to illustrate the major types of Antarctic crustal structure and its reworking by riftogenic processes. It is suggested that the unique intensity of rifting which leads to disintegration of the Antarctic continental landmass may be related, at least partly, to the presence of an ice sheet capable of affecting the tectono-thermal regime at lower crustal levels and a possible mechanism of this influence is discussed. Ritzwoller, M.H., Bentley, C.R., **Magnetic anomalies over Antarctica measured from MAGSAT,** Antarctic earth science; fourth international symposium. Edited by R.L. Oliver, P.R. James and J.B. Jago, Cambridge University Press, 1983, p.504-507, 31 refs.

DLC QE350.A57 1983

MAGSAT satellite vector magnetic anomaly data have been used to create a scalar magnetic anomaly map over Antarctica and the nearby oceans. The temporal stability of the anomaly features, together with their correlation with well-known oceanic tectonic structures, indicates that the source of the observed anomalies lies within the Earth. Specifically, magnetic anomalies are associated with oceanic basins (negative) and ridges (positive) and with such continental features as tectonic provinces (positive and negative), hypothetical rift features (negative), several mountain ranges (positive and negative), and a subglacial basin (positive). At least two of the largest magnetic anomalies in Antarctica are mirrored by anomalies at the corresponding locations in other Gondwana continents. The map appears to possess information relevant to the large-scale structure and development of Antarctica, but must be used with care due to ambiguities inherent in its interpretation. (Auth.)

Ikami, A., Ito, K., Shibuya, K., Kaminuma, K., **Crustal structure of the Mizuho Plateau, Antarctica revealed by explosion seismic experiments,** Antarctic earth science; fourth international symposium. Edited by R.L. Oliver, P.R. James and J.B. Jago, Cambridge University Press, 1983, p.509-513, 22 refs.

DLC QE350.A57 1983

From 1979 to 1982, explosion seismic experiments were carried out near Showa Station and in the northern Mizuho Plateau. The primary object of these experiments was to investigate a velocity/depth profile of the crust and upper mantle. The biggest explosion was fired in the sea near Showa Station, and 27 temporary seismic observation stations were set up along a 300 km long profile between Showa and Mizuho Stations. In addition to this, two big explosions in ice holes were fired at the southern end and the middle point on this profile. Refraction waves from the Conrad and the Moho discontinuities were successfully recorded. The apparent P-wave velocity in the upper crust ranges from 6.0 km/s to 6.4 km/s, suggesting a gradual increase with depth. Apparent velocities of 6.9 km/s for the Conrad discontinuity and 7.9 km/s for the Moho discontinuity were observed from the biggest shot near Showa Station, but the true velocities could not be determined. The crustal structure in the northern Mizuho Plateau was determined from travel times, and the depth of the Conrad and Moho discontinuities were defined as about 30 km and about 40 km, respectively. (Auth.)

Kaminuma, K., Shibuya, K., **Geophysical investigation in the eastern part of Lützow-Holm Bay, Antarctica,** Antarctic earth science; fourth international symposium. Edited by R.L. Oliver, P.R. James and J.B. Jago, Cambridge University Press, 1983, p.519-521, 6 refs.

DLC QE350.A57 1983

Almost all gravity stations on the snow free area in the eastern part of Lützow-Holm Bay have negative free air anomalies from -15 to -35 mgal. The free air anomaly in the central part of Lützow-Holm Bay is as low as -90 mgal and increases gradually towards the eastern coast of Lützow-Holm Bay. The Bouguer anomalies in the northern part of Lützow-Holm Bay are about 44500-45400 gamma. A borehole type and a set of water tube tiltmeters were installed at Showa Station in 1981. An annual change of 12 microradian (maximum) in an E-W direction and 22 microradians (maximum) in a N-S direction was observed from April 1981 to January 1982. The annual change corresponds to the temperature variation of the subsurface at a depth of 1 m at which observation was also started at Showa Station in 1980. (Auth.)

DLC QE350.A57 1983

Outcropping rocks from Enderby, Kemp and Mac. Robertson Lands, Antarctica have previously been divided into two main groups, an Archaean age Napier Complex of granulite metamorphic grade, and a Late Proterozoic age Rayner Complex that was largely formed by remetamorphism of the older rocks, generally to a slightly lower metamorphic grade. Rock type boundaries are here mapped between outcrops using both medium wave length magnetic anomalies, and the apparent susceptibility of rock topography inferred from the correlation between short wave length magnetic anomalies and short wave length topography. Both apparent susceptibility and medium wavelength anomalies are average to slightly low over the Napier Complex, very high over the non charnockitic part of the Rayner Complex, and high over the charnockitic part. The correlation of short wavelength magnetic anomalies with rock topography, and the results of Werner deconvolution of the magnetic profiles, are both consistent with the rock surface under ice cover corresponding to magnetic basement. Hence, an appreciable thickness of non magnetic sediments is not likely to be present in this part of the landmass of Antarctica. Maps of Faye gravity anomalies and smoothed rock altitude have almost identical medium wavelength features. It is inferred from this that isostatic compensation of topography is both regional and deep, and that the upper crustal rocks have a nearly constant density. (Auth.)

Grindley, G.W., Oliver, P.J., **Palaeomagnetism of cretaceous volcanic rocks from Marie Byrd Land, Antarctica,** Antarctic earth science; fourth international symposium. Edited by R.L. Oliver, P.R. James and J.B. Jago, Cambridge University Press, 1983, p.573-578, 25 refs.

DLC QE350.A57 1983

Palaeomagnetic determinations from 26 widely separated sites (42 oriented blocks) from Upper Cretaceous rhyolitic volcanics and mafic dyke swarms in the Ruppert/Hobbs Coast sector of Marie Byrd Land define a mean direction of stable magnetisation. The sampled rocks post-date the emplacement of Lower Cretaceous calc-alkaline granite plutons and are associated with the early stages of rifting of the South Pacific oceanic basin. All sampled rocks are normally magnetised and were emplaced during the long Late Cretaceous epoch of normal polarity as indicated by radiometric dates (90-110 Ma). No evidence for significant post-emplacement remagnetisation or tectonic disturbance was found. The Cretaceous palaeopole position for Marie Byrd Land lies significantly eastward of the Apparent Polar Wander Path (APWP) for Australia and New Zealand, reconstructed by reversal of sea-floor magnetic anomalies on to Antarctica. This might indicate minor extension and/or dextral rotation along a plate boundary with East Antarctica. This palaeomagnetic study does not support speculations that Marie Byrd Land is an exotic microplate that drifted into its present position in the Late Cretaceous or Early Tertiary. Indeed, the evidence is consistent with Marie Byrd Land being an eastward extension of New Zealand and the Campbell Plateau. (Auth.)

DLC QE350.A57 1983

The Earth's magnetic poles are those places where a freely-suspended magnetic needle would stand vertically—i.e. where the angle of dip is 90 deg. Douglas Mawson and his two companions from Shackleton's "Nimrod" expedition were the first and only persons to stand at the south magnetic pole (SMP) which they reached on 16 January 1909. They fixed its position (72.4 S, 155.3 E, in Victoria Land) by direct measurements, but since then it has been determined mainly from analyses of global magnetic observatory and survey results. Thus, from the 1980 analysis, the sMp is estimated now to be about 1000 km to the NW of Mawson's location, some 100 km out to sea from the French station Dumont d'Urville. This motion of the magnetic (or dip) poles contrasts with that of the geomagnetic (or dipole) poles which have been stationary for at least 150 years. Such motion is a manifestation of the general secular variation of the Earth's internal magnetic field, and in common with other features is erratic and not accurately predictable. Because secular variations are thought to be due to localised current systems near the surface of the earth's core, it is to be expected that the north and south magnetic poles have independent characteristics—e.g. they are not antipodal. Although their motions are not synchronous their average rates and directions during this century have been similar: 10-15 km per annum north to northwesterly. (Auth.)

Vogt, P.R., Cherkis, N.Z., Morgan, G.A., **Project investigator-I: evolution of the Australia-Antarctic Discordance deduced from a detailed aeromagnetic study,** Antarctic earth science; fourth international symposium. Edited by R.L. Oliver, P.R. James and J.B. Jago, Cambridge University Press, 1983, p.608-613, 16 refs.

DLC QE350.A57 1983

A detailed aeromagnetic study over the Australia-Antarctic Discordance (AAD) and adjacent portions of the Southeast Indian Ridge (SEIR) exposes the kinematic details of plate boundary evolution over the last 25 Ma. The present crenulated geometry of the AAD developed from a combination of continuous asymmetric spreading along most of the boundary (north flank faster by 5mm/year), and propagating rifts which abruptly changed the offsets of the transforms bounding the AAD. Rift propagation may have been initiated by a change in rotation pole 7 to 4 Ma, and also by asthenosphere flow towards the AAD along adjacent spreading centres. Continuous asymmetric spreading in the AAD area has been episodic, with maximum asymmetry (ca. 10-15 mm/year) at 2-3 Ma intervals. (Auth.)

Oborina, S.F., Sytinskiĭ, A.D., **Seismic investigations in Antarctica** [Seĭsmicheskie issledovaniia v Antarktike], 25 let Sovetskoĭ antarkticheskoĭ ekspeditsii. (25 years of Soviet antarctic expeditions). Edited by E.S. Korotkevich and L.I. Dubrovin, Leningrad, Gidrometeoizdat, 1983, p.74-93, In Russian. 34 refs.

Seismic investigations carried out by the Soviet antarctic expeditions over a period of 25 years are discussed. Seismic maps of Antarctica, for the 1910-1960 and 1961-1979 periods, are presented, as are graphs and tables showing surface wave dispersion and average crustal thickness in Antarctica and the southern ocean. Earthquake epicenters are located along the antarctic coastline. Dynamic processes of the antarctic ice cover are determined on the basis of seismic observations at Mirnyy Station. Ice sheet flow is estimated on account of iceberg calvings. Hydrometeorological conditions related to the development of microseisms are also investigated.

Rydelek, P.A., Knopoff, L., **Spectral analysis of gapped data: search for mode 1S1 at the South Pole,** *Journal of geophysical research,* Mar. 10, 1984 89(B3), p.1899-1902, 10 refs.

The exigencies of operating an ultralong-period seismometer/-gravimeter at the South Pole have obliged us to search for evidence for the pendulum mode of the earth's inner core as a signal with poor signal-to-noise ratio, recorded with lengthy interruptions in the time series. In our method for identifying a weak, almost harmonic time signal in the presence of record gaps, we assume the signal is phase coherent for the full time series across the gaps and perform Fourier analysis of the full data sequence. The signal-to-noise ratio is improved by 1(M)1/2 over the case where individual gapped segments are summed, where M is the number of segments. Analysis of the recordings from the South Pole both before and after the Sumbawa earthquake shows no spectral line identifiable with the pendulum mode that is above the noise level. (Auth.)

Bergman, E.A., Nábělek, J.L., Soloman, S.C., **Extensive region of off-ridge normal-faulting earthquakes in the southern Indian Ocean,** *Journal of geophysical research,* Apr. 10, 1984 89(B4), p.2425-2443, 77 refs.

An unusually large number of off-ridge earthquakes has occurred within a broad region astride the Southeast Indian Ridge. The source mechanisms of nine of these earthquakes, in lithosphere from 4 to 27 m.y. old, have been determined with a formal inversion technique based on matching observed and synthetic P and SH waves. All events occur in the oceanic mantle, from 8 to 22 km below the seafloor. The seismic moment and duration of faulting obtained from the inversion constrain the stress drop to lie between a few tens of bars and a few hundred bars for most of the events. All of the off-ridge earthquakes are characterized by normal-faulting mechanisms, with the T axes nearly parallel to the nearby ridge axis, in sharp contrast to typical mid-ocean ridge or intraplate earthquakes. No single mechanism is adequate to explain all the observed off-ridge normal-faulting earthquakes. An apparent asymmetry in the observed seismicity with respect to the ridge suggests that the earthquakes on the Antarctic and Indian plates are caused by different processes. The Antarctic plate events can be satisfactorily attributed to the release of thermal and bending stresses associated with a residual depth anomaly between the Kerguelen Plateau and the Southeast Indian Ridge, a region which has been suggested as the site of horizontal "pipe" for flow in the asthenosphere from the Kerguelen hot spot to the vicinity of Amsterdam and St. Paul islands on the Southeast Indian Ridge. Ito, K., Ikami. A., Shibuya, K., Kaminuma, K., **Upper crustal structure beneath the Ongul Islands, East Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Feb. 1984 Ser C No.15, p.3-12, 9 refs.

Two explosion seismic experiments were conducted in 1980. In one experiment eleven stations were established along a line 5.2 km long at intervals of about 0.5 km on the outcrops on East and West Ongul Islands and two explosions of 100 and 80 kg were fired at the bottom of the sea. The other smaller-scale experiment was made on East Ongul Island to reveal the structure shallower than that obtained by the above-mentioned experiment. In both experiments direct waves were clearly recorded at all the stations as first arrivals. The mean apparent velocity and the mean average velocity of *P*-waves are 6.19-0.11 and 5.74-0.88 km/s, respectively. The obtained velocity in the ice-free area of the Ongul Islands is nearly the same as the velocities under the ice sheet in East Antarctica obtained by the research expeditions of the United States, USSR and Japan. (Auth. mod.)

Ikami, A., Ito, K., **Deep crustal structure along the profile between Syowa and Mizuho Stations, East Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Feb. 1984 Ser C No.15, p.19-28, 17 refs.

Twenty-seven temporal seismic observation stations were set up along a 300-km long profile from Showa to Mizuho Stations. Explosives were fired near Showa Station, near Mizuho Station and at the middle point of the profile. The apparent *P*-wave velocity in the upper crust varies from 6.0 to 6.4 km/s, suggesting a gradual increase of the *P*-wave velocity with depth. Apparent velocities of 6.9 km/s for P-star and 7.9 km/s for P-n were observed from the biggest shot near Showa Station. From analyses of travel times and an amplitude study by synthetic seismograms, the crustal structure of the northern Mizuho Plateau was determined. The depth of the Conrad and the Moho discontinuities was determined as about 30 km and 40 km, respectively. Comparing our results with those in Dronning Maud Land velocity values are nearly the same, but the thickness of lower crust in the northern Mizuho Plateau is about half of that in Dronning Maud Land. Rydelek, P.A., Knopoff, L., **Long-period solar tides at the South Pole,** *Antarctic journal of the United States,* 1983 18(5), p.59-60, 4 refs.

Amundsen-Scott South Pole Station is uniquely located for observing both the lunar and solar long-period vertical Earth tides. At the South Pole these tides have maximum amplitude. From several year-long records the gravimetric factor and phase angle for the lunar semimonthly tides and the gravimetric factor for the lunar monthly and termonthly tides have been determined. The spectral estimates show the presence of a strong semiannual component along with other smaller components at annual and terannual periods. A tidal origin is indicated for the semiannual component. The causes of semiannual fluctuations in pressure and temperature observed at the South Pole are as yet unresolved.

Watts, D.R., Watts, G.C., Bramall, A.M., **Cretaceous and early Tertiary paleomagnetic results from the Antarctic Peninsula,** *Tectonics,* June 1984 3(3), p.333-346, 24 refs.

When combined with previously published data, results show construction of a polar wander path that is very similar to one derived for the East Antarctic craton by rotating Tertiary and Cretaceous poles from India and Australia into the Antarctic frame of reference. When considered in this context, the paleomagnetic data from the Orville Coast, which was previously interpreted as evidence in favor of oroclinal bending or relative rotation of the southern Antarctic Peninsula with respect to the northern part, may be considered as an *in situ* result. The implications of the new data are: (1) The Antarctic Peninsula down to the Orville Coast has been a part of the Antarctic plate since 100 m.y. ago. (2) Movement of the Antarctic Peninsula required to avoid overlap in reconstructions of Gondwanaland must have occurred before 100 m.y. ago. (Auth.)

Bentley, C.R., Shabtaie, S., Lingle, C.S., Blankenship, D.D., **Analysis of geophysical data from Dome C and the Ross Ice Shelf,** *Antarctic journal of the United States,* 1983 18(5), p.104-105, 10 refs.

Geophysical data from Dome C and the Ross Ice Shelf are summarized under the following headings: electrical resistivity studies: soundings and computer modeling; seismic studies; subglacial geology at Dome C; and retreat of ice streams in the Ross Sea embayment. It has been demonstrated that electrical resistivity soundings can be used to estimate the depth at which the Recent-Wisconsin boundary exists. Further, it may be possible, using resistivity soundings, to trace the climatic boundary in an ice sheet by making measurements at stations along a flow line. Studies of the subglacial lithology at Dome C imply that the rock is most likely andesite or basalt and that this portion of the continent was located at a high magnetic latitude when the rock was emplaced. Work has continued on the development of a numerical model of a polar ice stream that is grounded below sea level.

Yuen, D.A., Schubert, G., **Global deformation of the Earth caused by large-scale continental glaciation: implications for the evolution of ice ages and the averaged thickness of the lithosphere,** *Antarctic journal of the United States,* 1983 18(5), p.121-122, 9 refs.

Recently the phenomenon of true polar wander since the late Cretaceous has been the subject of a number of investigations since it may have a bearing on the diverse areas of mantle convection and the evolution of ice ages. Such types of polar motions can influence as well the characteristic time scale of ice ages from earlier geological epochs, such as the Silurian which took place some 400 million years ago. It is suggested that true polar wander may furnish a mechanism which could eventually terminate the ice-age cycles. This premise is explored.

Hart, S.R., **Large-scale isotope anomaly in the Southern Hemisphere mantle,** *Nature,* June 28, 1984 309(5971), p.753-757, 47 refs.

Basalts from many Southern Hemisphere regions have anomalous Sr and Pb isotopic characteristics. This article shows that the isotopic mantle anomaly is globe-encircling in extent, centred on latitude 30 S. Arguments suggesting that this mantle anomaly has been in existence for billions of years place severe constraints on mantle convection models. Maps are included showing the global extent of the anomaly and these were augmented by data from the subantarctic islands and from coastal stations in Antarctica. (Auth. mod.)

Nagao, T., **Topographic features around Syowa Station as viewed from gravity measurements—some implications on the bedrock topography under the ice sheet,** *Antarctic record,* Aug. 1984 No.82, p.20-29, In Japanese with English summary and figure captions. 8 refs.

The coefficients of correlation between the reduced gravity anomaly and the bedrock height were calculated using gravity data in the Lützow-Holm Bay region and on Mizuho Plateau. A good positive relationship between the bedrock height and the reduced gravity anomaly was found on the sea ice and in the ice-free area of Lützow-Holm Bay and in the ice-free area of the Yamato Mountains. On the contrary, the correlation between the reduced gravity anomaly and the bedrock height at gravity stations on the ice sheet whose ice thickness was measured by an ice radar survey showed a weak negative relationship. This fact may suggest that the determination of ice thickness by an ice radar on the ice sheet was inaccurate. The negative relationship between the reduced gravity anomaly and the bedrock height in the Mizuho Plateau means that the isostasy of this area is incomplete. (Auth.)

Adams, R.D., Zhang, B.M., **Further earthquake on the Kerguelen Plateau,** *Geophysical journal,* Nov. 1984 79(2), p.697-703, 9 refs.

The "search" procedure of the International Seismological Centre for previously unreported earthquakes has located a further earthquake on the eastern edge of the Kerguelen Plateau, about 1200 km SSE of Kerguelen Island. This event (Mb 4.7) occurred on 1981 April 6, and was about 65 km west of a larger event (Mb 5.2) that occurred in 1973. These two earthquakes are the only ones known to have occurred on the Plateau, apart from three events close to Kerguelen Island. The position of the new event is about midslope on the steep eastern edge of the Plateau, and analysis of depth phases confirms that it occurred in a water depth of 2.2 km, with a focal depth of 10-12 km beneath the seafloor. Similar analysis of the earlier event, which is beneath the bottom of the slope, places it at a depth of 20-25 km, near the base of the crust, and indicates that there is a likely thickness of about 1 km of unconsolidated sediment in this area. (Auth.)

Schäfer, U., **Magnetic measurements in the region of the Schirmacher Oasis (Queen Maud Land) during the 25th SAE and preliminary data interpretation** [Magnetische Vermessung im Gebiet der Schirmacher Oase (Königin-Maud-Land) während der 25. Sowjetischen Antarktisexpedition und erste Interpretationsergebnisse], *Geodätische und geophysikalische Veröffentlichungen, Reihe 1,* 1983 No.9, Symposium zur Antarktisforschung der DDR, Garwitz 1982, p.18-30, In German with English and Russian summaries. 16 refs.

Relations between the geomagnetic anomaly field and structural geologic features are derived from photomaps. The magnetic anomaly pattern confirms the distribution of definite rock series and a fault zone within the oasis. The interpretation of magnetic measurements with regard to results of other geophysical investigations made on the surrounding glaciers allowed conclusions about texture and composition of the earth's crust in the ice shelf region of the northern marginal zone of the Antarctic continent. The measuring method is described and supplemented by a data catalogue.

Nagao, T., Kaminuma, K., **Estimation of the crustal structure and the bedrock topography by the gravitational method around Syowa Station, East Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Sep. 1984 Special issue No.33, p.1-8, 13 refs.

Gravity survey was carried out at 303 stations in Lützow-Holm Bay and in the Mizuho Plateau during the wintering in 1981. Using the gravity data, the crustal structure in the Lützow-Holm Bay region and the bedrock topography in the Mizuho Plateau have been revealed in this study. The results are as follows: In Lützow-Holm Bay, the thickness of the crust increases from northwest to southeast. In the Mizuho Plateau, at least two subglacial valleys exist near Mizuho Station, whose strike is estimated to be consistent with the flow direction of the ice sheet. In the Yamato Mountains region, the crustal thickness is larger than that in the Lützow-Holm Bay region by about 3.8 km estimated from the result of simple Bouguer anomaly difference. And the difference of the crustal thickness between Showa and Mizuho Stations is less than 2 km. (Auth.)

Yukutake, H., Ito, K., **Velocities of *P* and *S* waves for drilling core rocks at Syowa Station, Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Sep. 1984 Special issue No.33, p.17-27, 18 refs.

Velocities of compressional and shear waves for drill core samples at Showa Station are measured at confining pressure up to 0.5 GPa (5 kbar). The samples consist predominantly of granitic complex or gneiss older than 350-533 m.y. in the shield region. Measurements of *P* wave velocities for three orthogonal directions and *S* wave velocities for two orthogonal directions reveal anisotropy of the rocks. Velocities increase rapidly with increasing pressure at low pressures below 50-120 MPa due to crack closure. Velocities increase linearly with increasing pressure at higher pressures than 50-120 MPa, but velocities for each direction are nearly the same. A velocity model in the upper 20 km of the crust is estimated from laboratory data, assuming an appropriate temperature profile. The proposed model of *P* wave velocity increasing gradually with depth is consistent with the upper crustal structure obtained by the explosion seismic experiments in the Ongul Islands and the Mizuho Plateau. (Auth.)

Kaminuma, K., Koyama, E., Ueki, S., **Preliminary report of the gravity survey in Ross Island, Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Sep. 1984 Special issue No.33, p.41-46, 4 refs.

Gravity surveys were carried out on Ross Island during the austral summer of 1982-1983. Twenty-one gravity stations were established in the summit area of Mount Erebus and eleven stations in the other area of Ross Island. The Bouguer gravity anomaly distribution shows a possibility of the maximum positive anomaly in the northeast side of the Erebus main crater, though the gravity stations are sparse there. This might be due to the fact that the structure of Mount Erebus is not a caldera type but nearly of the same type as the Kilauea Volcano of Hawaii Island and the O Sima Volcano of Japan. (Auth.)

Segawa, J., Kaminuma, K., Ueda, Y., **Sea gravimeter of the icebreaker *Shirase*,** *Tokyo. National Institute of Polar Research. Memoirs,* Sep. 1984 Special issue No.33, p.48-60, 5 refs.

The gravimeter system of the *Shirase* is the NIPRORI-1 sea gravimeter which was transferred from the icebreaker *Fuji*. During installation on the *Shirase* some changes for adaptation as well as some improvements for enhancing the capabilities were made. The main differences are as follows: The gravity sensor unit and the data processing unit were installed in separate rooms. An air-cushioned board was placed in the gravity sensor room in order to reduce vibration of the floor caused by the engines. The data processing unit was expanded, and computers and floppy disks were doubled. Temperature regulation of the gravimeter was improved, so that it became possible to detect the tidal variation of gravity by the use of the existing gravity sensor. The operation by interrogation software element was improved and the noise filtering was refined. (Auth.)

L-31152

Mishra, D.C., **Magnetic anomalies—India and Antarctica,** *Earth and planetary science letters,* Nov. 1984 71(1), p.173-180, 19 refs.

Magnetic anomalies over the continental shelf off the east coast of India suggest the presence of a highly magnetic rock type magnetized with an intensity of 900 nT in a direction, azimuth *(A)* = 150 deg and inclination *(I)* = +65 deg. This suggests the occurrence of igneous volcanic rocks which is confirmed from samples found below Tertiary sediments from a few boreholes in this region. A small strip of the body near the continental shelf margin appears, however, to possess normal magnetization suggesting the occurrence of normal and reversed polarities side by side, a characteristic typical for oceanic magnetic anomalies. The reversed polarity of the rocks on the continental shelf suggests that they correspond probably to the M0 reversal (115 m.y.) on world magnetostratigraphic scale and provide a paleolatitude of 47 S for the land mass of India which agrees with the palaeoreconstruction of India and Antarctica. In this reconstruction, the Mahanadi Gondwana graben on the Indian subcontinent falls into line with the Lambert Rift in Antarctica, suggesting a probable common ancestry. The volcanic rocks on the continental shelf off the east coast of India might represent a missing link, that is, rocks formed between India and Antarctica at the time of the break-up of Gondwanaland. Hebert, D., **Investigation of the postglacial isostatic coastal uplift of Enderby Land (East Antarctica) on the basis of C-14 dating results** [Untersuchungen zur nacheiszeitlichen isostatischen Küstenhebung des Enderby-Landes (Ostantarktika) auf der Grundlage von 14C-Datierungsergebnissen], *Petermanns geographische Mitteilungen,* 1984 128(3), p.183-188, In German with English and Russian summaries, p.247-248. 33 refs.

Organic samples (moss, lichens, penguin guano, sediment) from the coast of Molodezhnaya (Enderby Land) were dated by means of C-14 analyses. In consideration of age and locality elevation above sea-level the mean rate of isostatic coastal uplift for the last 2,000 years has been determined at about 2 m/100 years. The rate of uplift decreases and is about 1 m/100 years at present. The interpreting model is applied to C-14 ages published for varied materials from other stations. The results indicate a considerable postglacial uplift of the East Antarctic coast of a least 100 m while there was not any noticeable uplift in the range of the Transantarctic Mountains, as expected. The results are classified under climatological aspects. (Auth.)

Schäfer, U., **Schirmacher Oasis in Queen Maud Land: first results of geomagnetic measurements** [Die Schirmacher-Oase im Königin Maud-Land: erste Ergebnisse geomagnetischer Vermessungen], *Zeitschrift für geologische Wissenschaften,* 1984 12(5), p.375-386, In German with English and Russian summaries. 18 refs.

The Schirmacher Oasis magnetic anomaly pattern derived from aerial photography shows a coincidence with structural geological features and rock formations. Magnetic anomalies in the ice shelf region 10-20 km and 50-60 km north of the Schirmacher area indicate possible unstable zones at the boundary between continental and transitional crusts. Geophysical data suggest that in this part of Queen Maud Land the marginal zone has been formed by a set of downthrow faults up to the shelf region. Two east-west striking, deep-seated faults in the ice shelf area are characterized by intensive magnetic anomalies. These anomalies are assumed to be connected with intrusions of basic magmatic rocks along the faults. Such tectono-magmatic processes are associated with fault tectonics from the beginning decay of the Gondwana continent. (Auth.)

Storey, B.C., Garrett, S.W., **Crustal growth of the Antarctic Peninsula by accretion, magmatism and extension,** *Geological magazine,* Jan. 1985 122(1), p.5-14, 74 refs.

A subduction-accretion model incorporating new geophysical data is presented to explain the geology of the Antarctic Peninsula from late Palaeozoic to Cenozoic time. According to the model, the peninsula consists of overlapping accretionary, magmatic and extensional regimes that were diachronous across the peninsula and have built the crust to its present form. The crust, which contains a small proportion of sialic basement, was mainly formed by accretionary and magmatic processes and modified to its present shape by extension. The Gondwanide Orogeny for the Antarctic Peninsula is interpreted in terms of the accretionary processes. (Auth.)

Vashchilov, IU.IA., Stroev, P.A., **Some structural features of the Antarctic Ocean and Antarctica according to gravity data,** *U.S. Defense Mapping Agency Aerospace Center. Report,* Jan. 1974 DMAAC-TC-1993, 19p., AD-775 876, 25 refs. For Russian original see 7L-12306.

The gravity field over the belt extending from 60 deg to the shores of the Antarctic continent was studied according to a procedure based on the concept of global plate movement. The method involved quantitative data interpretation by bilogarithmic nomograms and by statistical analysis. Quantitative interpretation of Bouguer anomalies allowed delineation of blocks with varied density determination of depths to the upper and lower boundaries of the blocks and density differences at the interfaces between the blocks. The results are discussed from geological and geophysical viewpoints.

Shibuya, K., Kaminuma, K., Ikami, A., Ito, K., **Magnetic anomalies along the traverse route from Syowa to Mizuho Stations, East Antarctica,** *Antarctic record,* Dec. 1984 No.83, p.51-61, In Japanese with English summary. 13 refs.

The 21st Japanese Antarctic Research Expedition (JARE-21) made aeromagnetic surveys along the traverse route from Showa to Mizuho stations by using a proton precession magnetometer. Reductions of International Geomagnetic Reference Field and diurnal variations were applied to the observed total intensity data, and the geomagnetic anomaly profile along the route was obtained. The uncertainty in the anomaly profile is considered to be 20-30 nT. There is a characteristic anomaly around S16-S30 which ranges from -250 to 350 nT. There is also another anomaly from H260 to Z50, which ranges from -270 to 140 nT. Both anomalies have the wavelength of 10-30 km. The correspondence of the ground data by JARE-17 with the obtained anomaly profile is rather good. A comparison was made of the geomagnetic anomaly profile with the previously obtained free-air gravity anomaly profile. (Auth.)

Kaminuma, K., Abe, K., Tanaka, H., **Leveling and gravity surveys at Syowa Station, Antarctica,** *Antarctic record,* Dec. 1984 No.83, p.62-74, In Japanese with English summary. 8 refs.

Leveling surveys were carried out in East Ongul Island, according to the first order leveling survey method of Geographical Survey Institute in Japan during the winter seasons of 1979 and 1982. The accuracy of the surveys between the leveling points was better than 0.4 mm. Gravity surveys using LaCoste-Romberg gravimeter model G were also carried out in 1979 and 1982. Twenty-five gravity stations were established in West Ongul Island in 1979. The gravity at six stations out of twenty-five was also measured by JARE-19 and -22 in 1978 and/or 1981. The gravity values of the two or three independent surveys at the same station were consistent with each other within the accuracy of 0.1 mgal. Five gravity stations were also established at the geodetic control points in small islands off Langhovde, and three stations near the water tube tiltmeter of two components at Showa Station. (Auth.)

Kaminuma, K., **Activities of Japanese earth science research in the McMurdo Sound region in the 1983-1984 season,** *Antarctic record,* Dec. 1984 No.83, p.81-87, In Japanese with English summary. 6 refs.

Japanese scientists visited McMurdo Station from November 11, 1983 to January 16, 1984 to participate in the International Mt. Erebus Seismological Studies. This was the fourth year of the cooperative project by Japan, the United States and New Zealand. The magnetic tapes which have been recorded since October 1983 were played back. The daily frequencies of volcanic earthquakes occurring in and around Mt. Erebus were counted and earthquakes were scaled. Two new telemetry seismic stations were established. Eight temporary seismic stations were established on the flank of Mt. Erebus for precise determination of the earthquake locations. One station was also established at Vanda Station for detecting local earthquakes. LaCoste-Romberg gravimeter model G was used at eight temporary seismic stations and five telemetry seismic stations. Four additional gravity stations were established on the northeast side of the summit crater of Mt. Erebus and another four stations at outcrops in the eastern part of Ross Island. (Auth.)

Adams, R.D., Hughes, A.A., Zhang, B.M., **Confirmed earthquake in continental Antarctica,** *Geophysical journal,* May 1985 81(2), p.489-492, 12 refs.

An earthquake of magnitude (Mb) 4.5 has been located by the International Seismological Centre, near 81S, 37E in the continental platform of East Antarctica, about 1200 km from the coast of Dronning Maud Land, and 500 km from the Pole of Inaccessibility. The event was found by the Centre's 'search' procedure, which is undertaken with a deliberate delay of about two years. It occurred on 1982 November 4, and its position is well determined from five stations in Antarctica, and four farther afield. This is the first earthquake definitely located in the interior of the antarctic continent, although there have been some earlier less well established claims, and other earthquakes have occurred near the coast, or associated with areas of volcanism or ice movement. (Auth.)

M. POLITICAL GEOGRAPHY

M-29145

What to do about Antarctica, *Nature,* Feb. 23, 1983 301(590117), p.551-552.

Comments on Special Consultative Meeting of Antarctic Treaty members at Wellington, New Zealand, February 1983, regarding the future of antarctic mineral resources are presented. It is pointed out that the definition of the circumstances under which the mineral resources might be exploited represents a problem not likely to be solved easily in spite of the friendly relationship between the treaty members. The future of the treaty, lessons to learn and risks to avoid are discussed. A danger is seen in the notion that more money should be spent on research in order to assure a visible presence, and it is suggested that a mechanism be found whereby quality of research would be rewarded rather than mere expenditure.

M-29149

Sarma, V., **Treaty goes to wider forum,** *Nature,* Nov. 1983 305(5937), p.753.

It is reported that the future of the Antarctic Treaty will be debated by the United Nations General Assembly, most probably toward the end of November, 1983, due to the issue raised about its alleged exclusiveness, and that most likely the secretary-general will be asked to carry out an investigation and report back next year.

M-29177

Joyner, C.C., **Antarctica and the law of the sea: an introductory overview,** *Ocean development and international law journal,* 1983 13(3), p.277-289, Numerous refs.

This article examines the potential for conflict between the Antarctic Treaty regime and the Convention recently produced by the Third United Nations Conference on the Law of the Sea. Should the UNCLOS III Convention enter into force, at least six issue-areas seem susceptible to future controversy in Antarctic waters, namely (1) seaward territorial limits; (2) resource management and conservation; (3) local environment protection; (4) marine scientific research; (5) deep seabed mining; and (6) archipelagic-island regimes. Accordingly, each issue-area is assessed as to its relevance for the Southern Ocean vis-à-vis the Antarctic Treaty parties, with a particular view towards signaling possible problems which involve conflict of interest and overlapping jurisdiction. (Auth.)

M-29178

Frank, R.F., **Convention on the Conservation of Marine Living Resources,** *Ocean development and international law journal,* 1983 13(3), p.291-345, Numerous refs.

The Convention purports to regulate national involvement in the Southern Ocean by managing the exploitation of all life in the nearly pristine Antarctic marine ecosystem. Krill and various species of fish have been harvested in the Southern Ocean for more than a decade, but at levels far below those that nearly led to the extinction of Antarctic whales and seals. The promise of this conservation Convention is to allow a stable level of harvesting of all species for the foreseeable future. If ratified, the Convention would create a supervisory Conservation Commission and an advisory Scientific Committee to monitor the extent and impact of harvesting activities, to coordinate the collection of information, and to restrict the species, areas, and levels of exploitation, thus preserving the integrity of the ecosystem. However, in order to accommodate political and economic national interests, the language of the Convention opens several loopholes in the key areas of voting, data collection, and non-party participation. Further, based as it is upon the Antarctic Treaty, the Convention seeks to perpetuate the strengths and weaknesses of the Treaty regime, particularly by maintaining the status quo regarding Antarctic territorial claims. Despite its flaws, the Convention seems to be a rational and timely compromise of competing national interests. It thus should serve as a model not only for the forthcoming Mineral Resources Convention, but also as a continuing symbol of the spirit of peaceful cooperation characterizing the Antarctic region. (Auth.)

M-29179

Boczek, B.A., **Protection of the antarctic ecosystem: a study in international environmental law,** *Ocean development and international law journal,* 1983 13(3), p.347-425, Numerous refs.

The legal status of Antarctica is largely determined by the 1959 Antarctic Treaty, and especially by the inner circle of the currently fourteen "consultative" status signatories. These states have given high priority to ecological considerations by enacting a series of environmental and conservationist regulations, as well as two conventions, one protecting the Antarctic seals and the other marine living resources in general. Environmental regulations will form an important part of the legal regime for the exploration and exploitation of the Antarctic mineral resources, primarily oil and gas. The Antarctic Treaty framework does not legally bind nonsignatory states, but under general international law all states are bound to refrain from inflicting damage upon the planet's environment. Also, some marine pollution conventions apply to the Antarctic waters, and the 1982 U.N. Convention on the Law of the Sea comprehensively covers the protection and preservation of the marine environment of all oceans and seas. The preservation of the Antarctic environment will remain a high priority irrespective of what legal regime will govern Antarctica after 1991 when the Antarctic Treaty may, and most probably will, be subject to review. Beck, P.J., **Science—and politics—on ice; India in Antarctica,** *Nature,* Nov. 1983 306(5939), p.106-107.

During India's first antarctic expedition—Dec. 1981 to Feb. 1982—an unmanned solar-powered station was established at 70 deg 45 min S 11 deg 38 min E to provide India with meteorological information. The second expedition followed and a third is planned. India's recent application for consultative party status in the Antarctic Treaty system, and the scientific, political and economic implications that go with it, are discussed.

M-29259

Westermeyer, W.E., **Politics of mineral resource development in Antarctica. Alternative regimes for the future,** Boulder, Westview Press, 1984, 267p., Refs. p.193-205.

This book examines the international legal issues surrounding future exploitation of resources in the Antarctic. Following an analysis of the Antarctic Treaty, twelve proposals viewed as most likely alternatives for a new international regime for the antarctic region are discussed. Employing a method known as multi-attribute utility analysis, each alternative is evaluated in terms of the relevant interests of the fourteen nations involved in order to determine which of the proposals best serves collective interests. Also addressed are such issues as the criteria for the nature of participation in an antarctic minerals regime, potential conflict among various development objectives, and the balance between environmental and developmental concerns.

M-29285

Scully, R.T., **Management in Antarctic Treaty activities,** *Sea technology,* Jan. 1983 24(1), p.40-41.

The author reviews significant events affecting Antarctica in 1982 and projects the level of U.S. activities there in 1983. He cites three important events: the coming into force in April 1982 of the Convention on the Conservation of Antarctic Marine Living Resources; the Special Consultative Meeting on Antarctic Minerals in Wellington in June during which the 14 Antarctic Treaty Consultative Parties began the process of defining an antarctic minerals regime; and the Presidential directive to maintain programs to support an active and influential U.S. role in Antarctica.

Deporov, IU., **Antarctica: a zone of peace and cooperation** [Antarktika—zona mira i sotrudnichestva], *Mezhdunarodnaia zhizn',* Oct. 1983 No.10, p.37-46, In Russian.

The geographical position of Antarctica is reviewed in terms of the role it plays in international communication and research. Territorial claims of the different nations with research stations in Antarctica are discussed. The articles of the Antarctic Treaty are reviewed, with special emphasis on those providing protection against nuclear waste and nuclear armament, as well as those dealing with conservation and rational exploitation of antarctic living and mineral resources. The Soviet Union endorses the Antarctic Treaty as one of the most important legal international documents of modern times, created for the support of peace and the eradication of danger not only in the Southern Hemisphere but on the entire planet.

M-29363

Larus, J., **India claims a role in Antarctica,** *Round table,* 1984 Vol.289, p.45-56, Refs.

The three phases of Operation Gangotri, the 1981 and 1982 Indian expeditions to Antarctica, are described. The Antarctic Treaty is reviewed, and the policies India supports as the newest member of the Consultative Parties group—that Antarctica be declared the common heritage of mankind, with resources available to all nations—are pointed out as crucial to the Third World states, in their collective quest for a better distribution of the world's resources.

M-29470

Maddox, J., **Antarctic mining regime at risk,** *Nature,* Jan. 1984 307(5947), p.105-106.

A short history of the Antarctic Treaty is presented, and the central issues on which critics from various governments have focused are reviewed. Some solutions to the problem concerning territorial claims are offered.

M-29492

U.S. Department of State, U.S. Arms Control and Disarmament Agency, **Report of the United States Antarctic inspection,** [Washington, D.C., 1975-1983], 4 reports, Unpublished manuscripts. Title varies. For inspection reports for 1961, 1967, and 1975 see 2M-2917, 3M-5594, and 7M-12807, respectively.

Under the terms of the Antarctic Treaty, each consulting party has the authority to inspect the stations of other consulting parties for compliance with the Treaty as regards the bans on military activity, nuclear explosions and waste disposal, and armaments in Antarctica. These four reports describe the results of inspections made by U.S. representatives during the years 1975, 1977, 1980, and 1983. Activities and facilities at each station visited are described in greater or lesser detail, including the scientific programs and equipment. In all reports each station was judged to be in compliance with the spirit and the letter of the Antarctic Treaty provisions cited.

M-29672

Da Gama Pinto, C., **Battle for the treasures of the last frontier on earth,** *South,* Dec. 1983 No.38, p.38-39.

The Antarctic Treaty is discussed from the point of view of the Third World, which is that the treaty nations do not have a mandate to negotiate a minerals regime and do not represent the whole international community. A map marking the location of stations of the signatory nations, as well as possible mineral deposits, oil, natural gas and coal, is included.

A brief review is given of polar international politics as it currently stands. It includes a comparison of regional claims and legal situations in the Antarctic and the Arctic. Pertinent Antarctic Treaty provisions and regional conventions among the Treaty consultative parties are discussed.

M-29707

Kimball, L., **Antarctica: summary and comment on background and recent developments,** Washington, D.C., International Institute for Environment and Development, 1984, 8p., Manuscript report.

A brief account is given of the establishment and effectiveness of the Antarctic Treaty and some of the accomplishments achieved under its provisions. In recent years criticisms have been made by nations not consultative parties to the Antarctic Treaty that the ATCP were administering Antarctica not in the best interests of the world community but in their own interests especially as regards mineral resources potentially there. ATCP spokesmen responded to these criticisms and these responses are summarized here.

M-29819

Mitchell, B., **Antarctica—the unanswered question,** *International Union for Conservation of Nature and Natural Resources. ICUN Bulletin,* Jan./Mar. 1984 N.S.15(1-3), p.9-10.

An overview is given of thoughts expressed by various representatives to the UN during the opening of discussions on the Antarctic. The UN Secretary-General has been charged to make a comprehensive, factual study of all aspects of Antarctica, taking fully into account the Antarctic Treaty system and other relevant factors. He will present a report of his findings in Nov. 1984. A review is presented of the accomplishments of the Treaty parties in Antarctica, especially with regard to the conservation of the marine living resources and current activities on the management of potential mineral resrources. ICUN near-term conservation plans for Antarctica are outlined.

M-29838

Beeby, C., **Towards an Antarctic mineral resources regime,** *New Zealand international review,* May/June 1982 7(3), p.4-6.

Antarctic mineral and marine living resources, and their current and future exploitation, are discussed. The need for a minerals regime and environmental protection is pointed out, and a set of principles upon which the future resources regime should be based is outlined.

M-29841

Barber, L., **Keeping New Zealand's back door closed,** *New Zealand international review,* May/June 1982 7(3), p.13-14.

It is pointed out that in the next century Antarctica will most probably be highly placed as a strategically important geopolitical zone.

M-29842

Shapley, D., **Arctic, Antarctic: a polarization of interest,** *Sea power,* Apr. 1983 26(5), p.104-105.

Recent events in the growing maritime activity in the Antarctic, by many nations, particularly those involved in krill fishing and marine geophysical research, are reviewed.

Gajardo V., E., **Chile, the Antarctic Treaty and its system** [Chile, el Tratado Antártico y su sistema], *Santiago de Chile. Instituto Antártico Chileno. Boletín antártico chileno,* July-Dec. 1983 3(2), p.7-15, In Spanish.

The origin, history and principles of the Antarctic Treaty are discussed, and the decisions and recommendations concerning it, resulting from the first Consultative Meeting, held in Canberra in 1961, through the 12th Consultative Meeting in 1983, are described.

M-29917

Norway in the Antarctic, *News of Norway,* May 18, 1984 41(7), p.39-41.

Norwegian interests in Antarctica are traced to whaling expeditions in 1892 and the first landing on the Continent in 1895. Situations and events leading to the annexation by Norway of Bouvet Island, Peter I's Island and Queen Maud Land are discussed. With a break during WW II, Norway has been active in scientific research programs there since 1929-1930. The Antarctic Treaty is discussed, the question of exploiting natural resources is outlined, and Norwegian views are presented regarding the functioning of the Treaty, territorial claims, and international cooperation.

M-29925

Jung, E.F., **Antarctica in world affairs,** *Aussenpolitik,* 1984 35(1), p.80-86.

Following a brief outline of physical Antarctica, its exploration history and commodity potential, the existing Antarctic Treaty system is reviewed. Some basic provisions are stated and the extent to which the Treaty is binding on nations not a party to it are discussed. Legal aspects are examined of how well the Treaty meets the requirements for international acceptance, i.e., open access, settlements for the common good, and effectivity. Potential conflicts are outlined: the strategic military value of Antarctica; territorial claims; mineral resources; and the clash between the consultative states and the international community vis à vis the "common heritage of mankind" concept. Comments of possible future trends of this political debate are offered.

M-29953

Fedorov, S.G., Malyshev, A.A., **Antarctic Treaty and problems of international control of exploitation of the living resources of the southern ocean,** Antarctic krill—biology, ecology, and distribution. Edited by T.G. Liubimova, New Delhi, Amerind Publishing Co., 1984, p.217-230, TT 82-00-100, 17 refs. For Russian original see 12M-25314.

International investigation of living resources of the southern ocean and steps taken by signatories of the Antarctic Treaty are discussed. The main principles of the conservation regime to be worked out within the framework of the Treaty are reviewed and the development of international juridical acts pertaining to the utilization of natural resources of the southern ocean is analyzed. Activities of various international organizations sponsoring research and exploitation of biological resources are considered. The important role of the Soviet fishery science in the exploration of the southern ocean under the complex international research-technical policy on further development of the area covered by the Antarctic Treaty is emphasized.

Wijkman, P.M., **Managing the global commons,** *International organization,* Summer 1982 36(3), p.511-536, Numerous footnotes and references.

DLC JX1901.I55

Natural resources over which no single nation or decision-making unit has a generally recognized exclusive jurisdiction are discussed, as are the fundamental policy issues associated with managing communal resources. The weaknesses of the Antarctic Treaty concerning comprehensive management of the Antarctic's living resources are pointed out.

M-30048

Charney, J.I., ed, **New nationalism and the use of common spaces: issues in marine pollution and the exploitation of Antarctica,** Totowa, NJ, Allanheld, Osmun & Co., 1982, 343p., Refs. and notes passim. For selected papers see A-30049, A-30050 and M-30051 through M-30053.

The nine chapters in this book are detailed studies of specific aspects of current and potential uses of two major uninhabited areas of the globe: the oceans and Antarctica. Chapters one through four discuss the question of marine pollution. Chapters five through nine discuss the legal, political, economic, environmental, and scientific aspects of the development of the resources of Antarctica. Seven appendixes cover antarctic scientific bases, stations and claims, the Antarctic Treaty of 1959, and reports of consultative meetings, conventions and recommendations concerning the conservation, and exploitation, of antarctic mineral and marine living resources.

M-30051

Bilder, R.B., **Present legal and political situation in Antarctica,** New nationalism and the use of common spaces: issues in marine pollution and the exploitation of Antarctica. Edited by J.I. Charney, Totowa, NJ, Allanheld, Osmun & Co., 1982, p.167-205, 29 notes and refs.

Legal and political considerations relevant to fashioning a regime capable of protecting the antarctic environment from harm from mineral exploration and exploitation are examined. The discussion covers three areas: the broad historical and legal context of present national activities in Antarctica, the present legal situation regarding ownership and jurisdiction with respect to antarctic resources, and the present legal situation regarding protection of the antarctic environment.

M-30052

Charney, J.I., **Future strategies for an antarctic mineral resource regime: can the environment be protected,** New nationalism and the use of common spaces: issues in marine pollution and the exploitation of Antarctica. Edited by J.I. Charney, Totowa, NJ, Allanheld, Osmun & Co., 1982, p.206-238, 90 notes and refs.

The alternative regimes that might be considered for antarctic mineral development are explored. This analysis proceeds in four steps: cataloging of interests that might influence the actions of participating nations; considering the feasibility of seeking the protection of one interest to the exclusion of all others, or whether to compromise; identifying procedures necessary for the protection of the environment so that the potential legal regimes can be evaluated; and reviewing alternative strategies in order to evaluate their feasibility and acceptability.

M-30053

Barnes, J.N., **Emerging Convention on the conservation of antarctic marine living resources: an attempt to meet the new realities of resource exploitation in the southern ocean,** New nationalism and the use of common spaces: issues in marine pollution and the exploitation of Antarctica. Edited by J.I. Charney, Totowa, NJ, Allanheld, Osmun & Co., 1982, p.239-286, 125 notes and refs.

Negotiations to develop a new international convention on exploitation and conservation of marine life in the ocean surrounding Antarctica are reviewed, and the impact of the Convention on the related international situation is discussed. It is concluded that the Marine Living Resources Convention which the Antarctic Treaty Consultative Parties have produced is a limited-purpose effort that leaves resolution of the critical juridical issues to the future, and that creates serious problems from the standpoint of sound environmental controls and decisions.

M-30186

Beck, P.J., **United Nations and Antarctica,** *Polar record,* May 1984 22(137), p.137-144, 32 refs.

The United Nations as a body has hitherto shown little interest or involvement in Antarctica. A recently developed campaign, led by several of the developing nations, now aims to involve the international community more closely in the management of the continent and its resources. Argument that Antarctica should be regarded as part of the common heritage of mankind finds little support among Antarctic Treaty nations, who favour continuing management under the treaty system. A nine-hour discussion in the First Committee of the United Nations General Assembly during November 1983 resulted in a resolution on "the question of Antarctica" which the General Assembly adopted unanimously on 15 December; the Secretary-General has been asked to report on "all aspects of Antarctica" in time for further discussion in September 1984. (Auth.)

De Castro, T., **Antarctica: the sixth part of the world** [Antártica: a sexta parte do mundo], *Atlas de relações internacionais,* [1971] No.20, Caderno especial da Revista brasileira de geografia, Vol.33, No.4, p.2-12, In Portuguese.

After a review of the geographic, economic and geological aspects of Antarctica, the sovereignty rights to the continent based on priorities of discovery and geographic proximity, are discussed. It is argued that discovery rights claimed by the signatory nations of the Antarctic Treaty are of a later date than those of Portugal. In addition, Brazil bases its claim on the right of polar partition which is illustrated by a map showing Antarctica divided into sectors representing geographic portions assigned to different nations. Each sector is a spherical triangle with its apex at the South Pole, its sides limited by meridians, and its base at the equatorial line. The Brazilian sector claimed is enclosed within the meridians Arroio Chui (55 W) and Martim Vaz (15 W).

Heimsoeth, H., **Antarctic mineral resources,** *Environmental policy and law,* Nov. 1983 11(3), p.59-61.

An interdisciplinary symposium, organized by the Institute for International Law of the University of Kiel, West Germany, in June 1983, is reported. The ensuing Special Consultative Meeting on Antarctic Mineral Resources, held in Bonn for government representatives of the 14 consultative parties of the Antarctic Treaty and their advisers, is reviewed. Preservation and protection of the antarctic environment are discussed, and legal issues are examined in the light of exploration and exploitation possibilities of the mineral resources and in agreement with the articles of the Treaty. Points in favor of the territorial claims of the consultative states are made against the argument favoring an international regime for Antarctica advanced by the nonaligned nations.

Golitsyn, V.V., **International law regime for Antarctica** [Antarktika: mezhdunarodno-pravovoĭ rezhim], Moscow, Mezhdunarodnye otnosheniia, 1983, 160p., In Russian. Notes and refs. p.152-158.

In the first chapter of this book, the geography of Antarctica, the history of its discovery, the growing interst in its resources, and the development of international cooperation in scientific research based on the articles of the Antarctic Treaty, are reviewed. The values of the Treaty, its applicability as a guiding example, are discussed in greater detail in chapters two and three, where the principles of international law governing territorial claims, the peaceful exploration—and rational exploitation—of antarctic living and mineral resources, and the right to free research, are extolled. Extensive literature, supportive of an antarctic regime based on international law, is reviewed.

M-30381

McKenzie, G., **National security and the Austral Crescent,** *Ohio. State University. Mershon Center. Quarterly report,* Spring 1984 8(4), 8p., 23 refs.

International interest in Antarctica is reviewed from a historical, political and economical point of view. In discussing the political role of the United States, the role of a peacemaker, the losses foreseen if the United States pulled out of Antarctica are as follows: the scientific resources of the continent; the potential mineral resources; the stabilizing role of the two major world powers; transportation capabilities and cold climate experience would be affected by the loss of American stations in Antarctica; the international good will of cooperative ventures. In addition, it is suggested that the military potential of the continent might be realized by others if the United states pulled out of the Treaty and the continent. The name Austral Crescent is explained: it covers an area encompassing all of West Antarctica and a little of East Antarctica, and the ocean portions connecting it to urban areas in the Southern Hemisphere. Its significance is outlined in terms of scientific, political, resource and transportation factors.

M-30430

Antarctica and New Zealand, *New Zealand. Ministry of Foreign Affairs. Information bulletin,* Aug. 1984 No.8, 48p.

The United Nations General Assembly in December 1983 adopted a consensus resolution requesting the Secretary-General to prepare a comprehensive, factual and objective study on all aspects of Antarctica, taking fully into account the Antarctic Treaty system and other relevant factors. It also requested the Secretary-General to seek the views of all member States in the preparation of the study. This Information Bulletin contains New Zealand's comments submitted in accordance with that request. Following remarks on the physical setting and exploration of Antarctica, and New Zealand sovereignty in the Ross Dependency, the comments develop New Zealand's views on the Antarctic Treaty with emphasis on scientific research and protection of the antarctic environment. Comments are also made on antarctic natural resources both living and mineral. Regarding an antarctic minerals regime, New Zealand strongly supports Recommendation XI-1 adopted at the Eleventh Consultative Meeting in 1981. This recommendation established the basic framework for the minerals regime and provided for, among others, maintaining the Antarctic Treaty in its entirety; protecting the antarctic environment;

protecting the interests of all mankind. Texts of primary agreements for the governing of Antarctica are included.

Kiel. Universität. Institut für Internationales Recht, Wolfrum, R., ed, Bockslaff, K., ed, **Antarctic challenge: conflicting interests, cooperation, environmental protection, economic development,** Veröffentlichungen des instituts für Internationales Recht an der Universität Kiel, No.88, Berlin, Duncker und Humblot, 1984, 253p., Proceedings of an interdisciplinary symposium, June 1983. Refs passim. For individual papers see A-30441, A-30445, B-30443, B-30444, E-30447, E-30448, M-30440, M-30442 and M-30446.

Sixty participants gathered from 14 countries including Argentina, Australia, Brazil, Chile, Denmark, Federal Republic of Germany, India, New Zealand, Norway, South Africa, Sri Lanka, United Kingdom, United States, and Uruguay. They met to exchange views on the status of Antarctica when territorial claims are juxtaposed with a minerals regime for the recovery of natural resources. The emphasis is on legal and political aspects but with discussions also on economic and environmental concerns. The viability of the Antarctic Treaty System is considered in relation to existing international law and the UN Convention on the Law of the Sea III (UNCLOS III). Texts of the Convention on the Conservation of Antarctic Marine Living Resources and recommendations IX-1 and XI-1 approved at Consultative Parties meetings are appended.

M-30440

Sollie, F., Heap, J., **Development of the Antarctic Treaty System—trends and issues,** Antarctic challenge: conflicting interests, cooperation, environmental protection, economic development, edited by R. Wolfrum and K. Bockslaff. Veröffentlichungen des Instituts für Internationales Recht an der Universität Kiel, No.88, Berlin, Duncker und Humblot, 1984, p.17-37, Comment by J. Heap, p.38-40.

Basic principles of the Treaty are pointed out: Antarctica to be used only for peaceful purposes, mainly in scientific research; military activities and nuclear explosions are banned; a free exchange of views; open inspections of all antarctic facilities; sovereignty or non-sovereignty claims are set aside, neither viewpoint being pushed. The evolution of the Treaty is shown through recommendations of the Treaty parties at consultative meetings. Pros and cons of the exclusivity of the Treaty parties are discussed. The concept of a scientific research effort free of politics is set forth as the key to the success of the Treaty System in conjunction with the requirement for full consensus with each provision of the Treaty and the Treaty as a whole. This concept is reinforced as the same consensus is required for the adoption of recommendations at consultative party meetings. Lengthy negotiating periods for complex issues and a tendency to avoid controversial issues are cited as the most serious weaknesses of the Treaty System. In his comments, Heap regards successes achieved through the Treaty System as being due to resolving problems before they become problems and the dedication and commitment of the parties to the idea of international cooperation without pushing the burr of territorial claims to a logical conclusion.

M-30442

Rauschning, D., **Discussion [on the impact of utilizing antarctic minerals on the Antarctic Treaty],** Antarctic challenge: conflicting interests, cooperation, environmental protection, economic development, edited by R. Wolfrum and K. Bockslaff. Veröffentlichungen des Instituts für Internationales Recht an der Universität Kiel, No.88, Berlin, Duncker und Humblot, 1984, p.57-66.

A general exchange of views addressed the question posed by Rauschning: How will the problem of using the mineral resources of Antarctica be resolved within the Treaty System without producing conflict between territorial claimants and non-claimants? Responding were Sollie, Heap, Guyer, Pinto, Barnes, and Wyndham. All agreed that the territorial claims issue is difficult but more a legal problem than a practical one. Sollie points out that Treaty nations in consensus have agreed as a fundamental principle, to recognize each other's viewpoint as regards territorial claims as long as the Treaty is in force. Wyndham believes that the two greatest achievements of the Treaty System have been the non-militarization and nonnuclearization of Antarctica. He says these have been achieved because a lot of people were determined that these things should be achieved and worked long and diligently to that end.

M-30444

Lagoni, R., **Convention on the Conservation of Marine Living Resources: a model for the use of a common good,** Antarctic challenge: conflicting interests, cooperation, environmental protection, economic development, edited by R. Wolfrum and K. Bockslaff. Veröffentlichungen des Instituts für Internationales Recht an der Universität Kiel, No.88, Berlin, Duncker und Humblot, 1984, p.93-108, Comments and discussion p.109-131.

The history of the Convention is reviewed from the recommendation made in 1977 through its development to its coming into force in 1982. Major concerns leading to the adoption of the Convention were: the threat to krill; that Antarctica might become the scene of international discord; and that outside influences, unknowing or uncaring about Antarctica's uniqueness, might intrude to develop legal rules and principles for marine living resources. The Convention embodies a landmark in the development of international law for the conservation of living resources by using an ecosystem approach through which the Convention applies to the region south of the Antarctic Convergence rather than using the Antarctic Treaty boundary of 60S. The Convention seeks to establish three major principles: prevent the decrease in size of any harvested population below that by which it can sustain itself; maintain ecological relationships between harvested, dependent, and related populations; and prevent irreversible changes in the ecosystem. All of these aspects of the Convention are discussed and comments and additional discussions are provided by Illing, Wyndham, Delbrück, Partsch, Dolzer, Pinto, Hempel, Rauschning, Barnes, Heap, Sahrhage, and the author.

M-30446

Wolfrum, R., **Use of antarctic non-living resources: the search for a trustee,** Antarctic challenge: conflicting interests, cooperation, environmental protection, economic development, edited by R. Wolfrum and K. Bockslaff. Veröffentlichungen des Instituts für Internationales Recht an der Universität Kiel, No.88, Berlin, Duncker und Humblot, 1984, p.143-163, Numerous refs. Comments and discussions p.164-188.

The topic is introduced by pointing out various models commonly cited when discussing the issue of using antarctic mineral resources: national solution, condominium, trusteeship, and common heritage. An alternative is presented based on the assumption that the Antarctic Treaty will serve as an umbrella for a future mineral resources regime, a supplementing, not competing regime. The presentation discusses various aspects and elements comprising the impact the Antarctic Treaty will have on such a regime; outlines a regime which attempts to accommodate the interests of the Consultative Parties; projects the conditions under which the new regime will have to be accepted by third states. These topics are explored in some detail and portions of them are commented on by Pinto who makes a presentation opposing the exclusivity of the Consultative Parties on antarctic affairs. Comment on the Impact of UNCLOS III on the antarctic regime is given by Miller and discussions are given by Jung, Croharé, Barnes, Reidel, Wyndham, Delbrück, Partsch, Sollie, Hempel, and Wolfrum.

M-30473

Anderson, A., **Minnows smell a rat,** *Nature,* June 7, 1984 309(5968), p.489.

A report and assessment is given of the outcome of the Antarctic Treaty Consultative Parties meeting in Tokyo in May 1984. The ATCP met to continue the process of developing a minerals regime for Antarctica.

M-30547

Joyner, C.C., **Oceanic pollution and the southern ocean: rethinking the international legal implications for Antarctica,** *Natural resources journal,* Jan. 1984 Vol.24, p.1-40, Numerous refs.

Two basic concepts are juxtaposed: the perceived need to recover and use antarctic natural resources and the need to prevent degradation to the environment and habitat in which the natural resources are found. Vessel and land-based sources for polluting antarctic waters are identified and discussed: the antarctic environment is described and efforts thus far made to conserve that environment are pointed out. Fundamental principles and mechanisms of the Antarctic Treaty and of the Convention for the Conservation of Antarctic Marine Living Resources are stated and the strengths and weaknesses of both documents are argued. Although no international regime now formally exists to protect, preserve and conserve Antarctica's marine environment, several possible courses which seem available to accomplish these ends are examined. Possibilities for conflicts in the Draft Convention of UNCLOS III and their impact on Antarctica are considered and an assessment is given.

M-30579

McKenzie, G.D., **Geopolitical and scientific roles of the United States in Antarctica,** Columbus, Ohio State University, Oct. 1983, 59p., Refs. p.54-59. Unpublished manuscript.

To understand the science and politics of Antarctica, one must be familiar with the background of the region. To provide this, a brief introduction is given to the physical setting, including the geography, physical features, geology, and climate. Next is a brief history of exploration, to show U.S. involvement and the development of commercial and scientific interests. Then, to set the stage for further discussions, the Antarctic Treaty and the groups currently interested in Antarctica are reviewed. Central to understanding our scientific and geopolitical roles is the resource situation. Resources remain the key to the future of Antarctica. Commercial gain, governed by national interest, now is the factor drawing other nations to Antarctica. Also, it is causing some treaty nations to reevaluate their research programs there. Resources are defined in the widest possible terms in this paper and include the obvious such as mineral resources to the less obvious such as scenic and scientific resources. Throughout the paper the importance is shown of all aspects of the Antarctic question to the United States and indirectly to national security. In the final chapter of the paper the focus is more on the national security aspects of emerging issues, and miniscenarios are presented that might develop if the U.S. were not present in Antarctica. The concept of the Austral Crescent, which is based mainly upon geographical and geological considerations that have an impact on the geopolitical approaches to the area is also presented. (Auth. mod.)

Auburn, F.M., **Legal implications of petroleum resources of the Antarctic Continental Shelf,** Chicago, University of Chicago Press, 1978, p.500-515, Ocean yearbook 1, edited by E.M. Borgese and N. Ginsberg. Numerous refs.

The emergence of antarctic petroleum resources as a political problem is reviewed. Touched upon as germane to the issue are: the severe antarctic weather; excessive distance to oil and gas markets; lack of technology for drilling in the antarctic environment; lack of solid evidence of commercially viable quantities of petroleum; national territorial claims; deleterious effects of oil spills; protection of offshore drilling rigs from icebergs; the Antarctic Treaty; and pollution of ice and sea water by wastes from drilling operations.

Luard, E., **Who owns the Antarctic,** *Foreign affairs,* Summer 1984 62(5), p.1175-1193, 1 ref.

The author provides as background a brief history of territorial claims made in Antarctica; the development of the Antarctic Treaty; the convention on living resources; and the emergence of non-living resources as a new source of international dispute. A set of conditions is laid out for the governance of the Antarctic and three broad measures are suggested as means for fulfilling these conditions. The system must provide for: continuing the existing demilitarized status in Antarctica; its regional use as base for scientific research; open access for legitimate purposes; above all, a stable system. The suggested measures include: a Treaty based regime; a wholly new regime; a regime which retains the Treaty for current purposes and establishes a separate resources management regime. Pros and cons of these possible solutions to a sticky question are discussed.

M-30823

Beck, P.J., **Antarctica: a case for the UN?,** *World today,* Apr. 1984 40(4), p.165-172.

Past and present disputes over territorial claims and natural resource exploitation in Antarctica are reviewed. The challenge posed to the Consultative Parties by non-member governments, to create a UN-based alternative to the Antarctic Treaty system, is discussed.

Roberts, N.S., **New Zealand interests in Antarctica,** *New Zealand international review,* Sep./Oct. 1983 8(5), p.6-12, Numerous refs. Revised version of a paper given at a NZIIA Antarctic Seminar.

The author examines the many facets of New Zealand's national interests and how they have altered over the years as concepts change of what national interests means. Development is traced of New Zealand's relationships with Antarctica and the strategic significance of the Antarctic Treaty to New Zealand is pointed out. Other relationships between the small country and the large cold continent are analyzed: American assistance, New Zealand's maritime capability, economic well-being, the meteorological program, mineral resources, political interests, territorial claims, making independent decisions, and promotion of national values. A conclusion is reached that New Zealand policy is following a middle path between "Think Big" and "Small is Beautiful."

Laking, G., Shearer, I.J., Beeby, C., Hatherton, T., Hopper, W.C., Machin, A., **Antarctic perspectives,** *New Zealand international review,* Sep./Oct. 1983 8(5), p.13-19, 1 ref. Excerpts from papers given at a NZIIA Antarctic Seminar.

Excerpts of papers by different authors are presented. Laking expounds on New Zealand's expanding relationship with its Pacific neighbors, environmental issues, trade, Antarctica and its resources. He favors a long view in which diplomacy is the catalyst for maintaining strong international cooperation. Shearer emphasizes that to protect the antarctic environment is a prime goal of a minerals regime; protection of reasonable benefits for New Zealand and international acceptance of the regime are also sought. Beeby urges the development of a minerals regime within the Antarctic Treaty system and that consideration be given to sovereign claims and the interests of the international community as a whole. Hatherton stresses the logistics aspects and New Zealand's need for a supply vessel. Hopper's primary aim is environmental protection; New Zealand's most pressing needs are support of its antarctic programs independent of U.S. assistance, and, to do this, an ice-strengthened supply ship. Machin states that the main theme underlying all interests in Antarctica is resource politics: by their interest in resources the Antarctic Treaty nations are unnecessarily stressing the Treaty. Environmentalists profess to have the panacea for antarctic problems: declare Antarctica to be a world park. With no support for this concept among the Treaty nations, they are taking the case to the United Nations.

M-31062

United Nations. Secretary-General, **Question of Antarctica: Study of the Secretary-General,** *United Nations document,* Sep. 1984 A/39/583 (Parts I and II), 4 pieces.

At the 38th Session of the UNGA, resolution 38/77 Dec. 15, 1983 requested the Secretary-General to prepare a comprehensive factual study on all aspects of Antarctica. Part I of the study is a composite of responses from about 50 member nations indicating their concerns regarding Antarctica and the Antarctic Treaty; deliberations on Antarctica at the 38th Session of the UNGA; the Antarctic Treaty System in practice; and scientific research and natural resources in Antarctica. Part II, consisting of three volumes, contains the responses of 54 nations.

Hayes, A.C., **Antarctica—challenge for the 1990s,** Newport, Naval War College, June 22, 1984, 33p., ADA-143 824, Student research paper. Notes and refs. p.27-32.

This paper looks at Antarctica from a strategic perspective, asking what the significance of the continent might be. Several areas are explored, ranging from military control of the Drake Passage, to resource exploitation, as possible challenges for the 1990s. A review of antarctic literature concludes that little work has been done in specifically establishing what the strategic concerns for the U.S. might be and consequently a warning intelligence matrix is lacking. A tentative definition of the threat in three forms is presented, along with a list of possible indicators which would guide collection, focus analysis, and support judgments relevant to developing threats. (Auth.)

Ferrero, A.A., **Antarctica: a strategic goal** [La Antártida como fin de una estrategia], *Antártida,* Feb. 1984 No.13, p.18-27, 30, In Spanish.

The article expresses an Argentine view of historical events leading to international interest in the Antarctic over the years, which ultimately led to the signing of the Antarctic Treaty. The existing treaty is denounced and an appeal is made to modify it in 1991. Diagrams showing portions of Antarctica claimed by different nations, the distribution of stations, areas of krill concentration in the antarctic waters, etc., are presented to illustrate the necessity of reviewing the Treaty.

Orrego Vicuña, F., ed, Infante Caffi, M.T., ed, Armanet Armanet, P., ed, **Chile's antarctic policy** [Política antártica de Chile], Santiago de Chile, Universidad de Chile, 1984, 307p., Refs. passim. For individual papers see B-31357, G-31355, -31356, M-31345 through 31354 and M-31358 through -31364.

Chile's current antarctic policy and historical orientations, from the points of view of geography, science and technology, conservation of the environment, antarctic mineral and living resources, law, international cooperation, and administration, are discussed in this collection of 20 articles from a working group on Chile's antarctic policy and a seminar on the same subject held in the Instituto de Estudios Internacionales of the University of Chile in December, 1983.

Orrego Vicuña, F., **Chile's extracontinental projection** [La proyección extracontinental de Chile], Política antártica de Chile, edited by F. Orrego Vicuña, M.T. Infante Caffi, and P. Armanet Armanet, Santiago de Chile, Universidad de Chile, 1984, p.15-34, In Spanish.

An interpretation of the maritime, antarctic and Pacific policies of Chile is presented in the light of that country's isolated geographic position. The law of the sea is broadly reviewed in its past and present application to Chile's rights of navigation, commerce, communication, and expansion in general, and into the Antarctic in particular.

M-31346

Romero J., P., **Chile's presence in the Antarctic** [Presencia de Chile en la Antártica], Política antártica de Chile, edited by F. Orrego Vicuña, M.T. Infante Caffi, and P. Armanet Armanet, Santiago de Chile, Universidad de Chile, 1984, p.35-50, In Spanish.

Chile's rights in Antarctica are reviewed in the light of historical events, such as the signing of various treaties from the Tratado de Tordesillas in 1494 to the Antarctic Treaty in 1961, the installation of Chilean bases in Antarctica, Chile's antarctic activities of several decades, and its participation in international research programs in the Antarctic.

M-31347

Toro Alvarez, C. de, **Historical tie between the continental territory and Antarctica** [Vinculación histórica del territorio continental y la Antártica], Política antártica de Chile, edited by F. Orrego Vicuña, M.T. Infante Caffi, and P. Armanet Armanet, Santiago de Chile, Universidad de Chile, 1984, p.51-65, In Spanish.

The geographic position and historico-legal events involving Chile with Antarctica are reviewed, as are the beginnings of whaling and sealing activities in general, and Chile's antarctic expeditions in particular. Included are lists of Chilean bases and refuges in Antarctica from the Capitán Arturo Prat naval base built in 1947 to the Teniente Rodolfo Marsh Martin air base built in 1980, and of Chilean participation in rescue operations involving other nations.

M-31348

Pinochet de la Barra, O., **Historic records of Chilean international policies in Antarctica. 1906, 1907 amd 1908 negotiations between Chile and Argentina** [Antecedentes históricos de la politica internacional de Chile en la Antártica. Negociaciones chileno-argentinas de 1906, 1907 y 1908], Política antártica de Chile, edited by F. Orrego Vicuña, M.T. Infante Caffi, and P. Armanet Armanet, Santiago de Chile, Universidad de Chile, 1984, p.67-80, In Spanish.

Legal precedents are traced from the 15th century onward to establish Chile's inheritance of Spanish colonial titles to the disputed portions of the Antarctic to which Great Britain, Argentina and Chile all claim sovereignty. A detailed account is given of the failed negotiations of 1906-1908 between Chile and Argentina to agree on an antarctic boundary between them, and of the events ending in an undefined-boundary-zone agreement in 1948.

M-31349

Gajardo Villaroel, E., **Records of the diplomatic negotiations prior to the 1959 Treaty and Chile's position** [Antecedentes de la negociación diplomatica previa al Tratado de 1959 y la posición de Chile], Política antártica de Chile, edited by F. Orrego Vicuña, M.T. Infante Caffi, and P. Armanet Armanet, Santiago de Chile, Universidad de Chile, 1984, p.81-87, In Spanish.

Events leading up to the Antarctic Treaty are reviewed, as are justifications for jurisdiction over antarctic areas claimed by Chile, the 1947 antarctic agreement between Chile and other South American countries known as the "Interamerican Mutual Assistance Treaty", and the interests in Antarctica by other nations which led to the signing of the Antarctic Treaty in 1959.

M-31350

Pinochet de la Barra, O., **Chile's contribution to the Antarctic Treaty** [La contribución de Chile al Tratado Antártico], Política antártica de Chile, edited by F. Orrego Vicuña, M.T. Infante Caffi, and P. Armanet Armanet, Santiago de Chile, Universidad de Chile, 1984, p.89-100, In Spanish.

The inception of the Antarctic Treaty is described by a member of the Chilean delegation to the Antarctic Treaty Conference in October 1959, from his notes and memories. The provisions of the Treaty and the role of Chile in promoting the protection and conservation of the antarctic environment are reviewed. In connection with the possible revision of the Treaty the author strongly advocates the continuation of peaceful international cooperation in antarctic research with no space or time limit.

M-31351

Riesco, R., **Antarctic geography as a basis of new political orientations** [La geografía antártica como base de nuevas orientaciones políticas], Política antártica de Chile, edited by F. Orrego Vicuña, M.T. Infante Caffi, and P. Armanet Armanet, Santiago de Chile, Universidad de Chile, 1984, p.103-113, In Spanish.

Antarctica and the South Pacific Ocean are discussed as a geographic and economic unit in what the author terms the "modern political-spatial concept of the industrialized world". Territorial domination of Antarctica, with its potential for economic exploitation and possible use as a base for intercontinental nuclear missiles, signifies to the author a definite alteration of the political, economic and military power which exists in the world today. From the perspective of political geography, Antarctica has reached Ratzel's premise of being "known, inhabited, and politically significant", thus capable of an outward action. Since the austral zone of South America represents a way of access to the antarctic continent, the author urges Chile and Argentina to develop a joint geopolitical awareness of their strategic advantages.

M-31352

Poupin Berttoni, M., **Populating Antarctica** [Poblamiento antártico], Política antártica de Chile, edited by F. Orrego Vicuña, M.T. Infante Caffi, and P. Armanet Armanet, Santiago de Chile, Universidad de Chile, 1984, p.115-118, In Spanish.

Of approximately 40 inhabited centers in Antarctica with their primarily coastal location, the author defines 3 as "head-centers" for their connective function with the rest of the world through their inter- and intracontinental accessibility and their nearness to antarctic land and sea resources. The three stations so defined are the Molodezhnaya, McMurdo and Teniente Rodolfo Marsh. The traditional policy of coadministration of the antarctic continent by various nations, while populating only the area that each nation claims as its own, is advocated.

Pincheira, G.V., **Scientific research as basis of antarctic national policy** [La investigación científica como fundamento de una política nacional antártica], Política antártica de Chile, edited by F. Orrego Vicuña, M.T. Infante Caffi, and P. Armanet Armanet, Santiago de Chile, Universidad de Chile, 1984, p.121-130, In Spanish.

A brief history of antarctic research is given, describing the inception of SCAR, the various challenges that researchers find in Antarctica, the current involvements—particularly that with krill—and the prospects for the next few years, prior to the possible revision of the Antarctic Treaty. It is believed that Chile must develop a national policy regarding Antarctica based on more intense scientific and technical exploration of the international problems and in agreement with Chile's foreign policy.

Ramírez Aranda, L., **SCAR and the development of scientific cooperation** [El SCAR y el desarrollo de la cooperación en materia científica], Política antártica de Chile, edited by F. Orrego Vicuña, M.T. Infante Caffi, and P. Armanet Armanet, Santiago de Chile, Universidad de Chile, 1984, p.131-146, In Spanish.

The history of the first and second International Polar Year and the International Geophysical Year of 1957-58, is outlined. Described in greater detail are the inception, constitution, organization and administration, regulations, and meetings of SCAR and the activities of its Groups of Specialists and Working Party subcommittees. The cooperation between the Antarctic Treaty system and SCAR, with regard to the protection and conservation of the antarctic environment, and the exploitation of its mineral and living resources, are discussed.

M-31358

Ariel Gallardo, V., **Environmental impact of possible antarctic mineral resource development** [El impacto ambiental del posible desarrollo de los recursos minerales antárticos], Política antártica de Chile, edited by F. Orrego Vicuña, M.T. Infante Caffi, and P. Armanet Armanet, Santiago de Chile, Universidad de Chile, 1984, p.191-222, In Spanish. 42 notes and refs.

Environmental considerations in the articles of the Antarctic Treaty are discussed, and the recommendations for conservation of the antarctic flora and fauna, presented by SCAR's biology Working Party and at various Consultative Meetings, are reviewed. The areas identified by the Group of Specialists on Environmental Impact Assessment of Mineral Resource Exploration and Exploitation in Antarctica as requiring major study—such as the reaction of the antarctic ice cover to pollution, topographic maps of antarctic permafrost, radiation, ocean and atmospheric circulation among them—are listed. It is concluded that the knowledge of the antarctic ecosystem now available is not sufficient to permit an adequate prediction of the environmental impact that mining would have in Antarctica. It is, therefore, recommended that all nations, Chile in particular because of its proximity to the area of interest, conduct experimental research in subantarctic regions rather than on the continent itself.

M-31359

Infante Caffi, M.T., **Antarctic mineral resources and their regime** [Los recursos minerales antárticos y su régimen], Política antártica de Chile, edited by F. Orrego Vicuña, M.T. Infante Caffi, and P. Armanet Armanet, Santiago de Chile, Universidad de Chile, 1984, p.225-236, In Spanish.

The discussion centers on Article IV of the Antarctic Treaty in relation to options of an antarctic national policy applicable to mineral resources. The problem of sovereignty in Antarctica is stressed and some ways in which it might be resolved are suggested. The history of Consultative Party recommendations at various conventions promulgated over the years is traced, and the conclusion is reached that agreement among consultative parties of the Treaty is indispensable for the establishment of a future minerals regime within the principles of the Treaty. The salient points of the elements defining the minerals regime are listed as: general obligations regarding the Antarctic Treaty; participating institutions; definition of stages and regulatory functions within the regime; other elements relevant to internal accommodation.

M-31360

Cabezas Bello, R., **Policy alternatives for the utilization of antarctic living marine resources** [Alternativas de políticas para la utilización de los recursos vivos marinos antárticos], Política antártica de Chile, edited by F. Orrego Vicuña, M.T. Infante Caffi, and P. Armanet Armanet, Santiago de Chile, Universidad de Chile, 1984, p.237-248, In Spanish., In Spanish. Refs. p.246-248.

Various alternatives are evaluated to determine the course of activities aimed at insuring the achievement of Chile's political, strategic and economic objectives regarding Antarctica. The discussion centers on the national and international exploitation of krill from the fishing, industrial, commercial, legal and administrative-feasibility points of interest. The policies proposed cover the areas of production, promotion, infrastructure, research, and management of antarctic fishing in agreement with the regimes of the law of the sea and those established by the Antarctic Treaty.

M-31361

Berguño, J., **Acceptability criteria of an antarctic minerals regime** [Criterios de aceptabilidad en un régimen para los minerales antárticos], Política antártica de Chile, edited by F. Orrego Vicuña, M.T. Infante Caffi, and P. Armanet Armanet, Santiago de Chile, Universidad de Chile, 1984, p.249-274, In Spanish.

Potential antarctic mineral resources are reviewed, as are the recommendations for a minerals regime regarding their exploration and exploitation promulgated by consultative parties at various meetings over the years. Among these recommendations, four solutions proposed for the problem of territorial claims are cited: agreement on the distribution of sovereignties; condominium of claimant nations; common human patrimony administered by the United Nations; and original statute. Some of the guiding principles to resolve a plurality of alternatives toward an acceptable regime include: conservation of peace, options, environment, and diversity; respect for other peaceful and legal uses of Antarctica; and support of scientific research.

A brief recapitulation of the interest in austral regions shown by many nations throughout history is presented, connecting it to the present legal regime governing Antarctica: the Antarctic Treaty. The debate concerning the Treaty at the 38th General Assembly of the United Nations, the preparation of an antarctic minerals regime, and the adaptation of the Treaty System are discussed in detail and cited as evidence of the growing international interest in Antarctica, the participation in its legal regime, and the exploitation of its resources.

Riesco, R.J., **Austral and antarctic geopolitics** [Geopolítica austral y antártica], *Santiago de Chile. Instituto Antártico Chileno. Boletín antártico chileno,* July-Dec. 1984 4(2), p.14-17, In Spanish. Originally published in 'El Mercurio de Santiago', May 29, 1984.

In this article the jurisdiction of the Antarctic Treaty, the geographic implications of the Treaty on the law of the sea, the percentage of global mineral reserves located in the Pacific Ocean, and the geopolitical perspective of Antarctica and the South Pacific Ocean as a unit, are discussed. Reference is made to Soviet concern over Chile's austral and antarctic activities.

M-31422
Valle, J. del, **Antarctic Treaty: example of international cooperation** [Tratado Antártico: ejemplo de cooperación internacional], *Santiago de Chile. Instituto Antártico Chileno. Boletín antártico chileno,* July-Dec. 1984 4(2), p.35-40, In Spanish.

This is the complete text of a talk given by Chile's Minister of Foreign Affairs at a ceremony held at the University of Chile to commemorate the 25th anniversary of the signing of the Antarctic Treaty. The past and present Chilean political and scientific involvements in Antarctica are emphasized, and their national as well as international character is pointed out. The significance of the Antarctic Treaty is discussed in detail.

Campos Pardo, O.A., **Antarctica, cold region of fiery, red-hot politics** [Antártida, región fría de política encendida, casi candente], *Antártida,* May 1982 No.12, p.4-7, 59, In Spanish.

The 11th Consultative Meeting of the Antarctic Treaty members, held in Buenos Aires June 23-July 7, 1981, and the preparatory meetings preceding it, as well as those following it, are reviewed. The highlights of the discussions, reflecting the economic and political interest of many nations in Antarctica, are presented.

M-31640
Yoshida, S., **Political environment surrounding antarctica** [Nankyoku o torimaker seiji kankyo], *Chiri,* March 1983 38(3), p.61-65, In Japanese.

The history of discovery of Antarctica and of its exploration and exploitation is reviewed, especially in relation to the various territorial claims arising from it. The regime of the Antarctic Treaty and its various aspects are discussed.

M-31676
Margerum, A.L., **Multilateral cooperation in antarctic marine ecosystem research,** Seattle, University of Washington, 1982, 182p., Master of Marine Affairs thesis. With 2 appendixes. Notes and refs. passim. Bibliography p.152-160.

After the introductory first chapter, the discussion in Ch. 2 of this thesis covers the relationship of the Antarctic Treaty to the Convention on the Conservation of the Antarctic Marine Living Resources; the living and mineral antarctic resources; the nations and organizations involved in Antarctica; and the evolution of the BIOMASS program with current and future plans for marine ecological research in the southern ocean. Principles for effective international scientific programs are discussed in Ch. 3. Chapter 4 is an analysis of five alternatives for facilitation of marine ecosystem research in the southern ocean. United States antarctic policy and the organization of funding mechanisms for U.S. antarctic marine ecological research relative to those five alternatives are discussed in Ch. 5. It is concluded that the Convention provides a beginning towards a more comprehensive management strategy for a balanced marine scientific research and economic and political interests in the southern ocean.

Refs. p.718-750.

DLC JX4173.W64

A review of a new development in the regimes governing the use of Antarctica, the high seas, the seabed and outer space—a development which departs from some of the established general principles of international law, and which will lead to a change in the functions of international organizations—is presented. An analysis of the Antarctic Treaty reveals that it only covers scientific research, prohibition of military activities and the protection of the antarctic environment. Its regulatory scope is quite limited compared to the law of the sea regime. However, the Antarctic Treaty taken as a unit with the supplementing resolutions of the Antarctic Consultative Parties makes up a legal framework imposing a set of obligations upon the States Parties which clearly serve community interests. To prove that the regimes governing the use of the high seas and of Antarctica reflect community interests, specific State obligations are reviewed.

Human immune humoral response in Antarctica [1983, spa] H-29140

Zwack, F.
Method for acoustic estimation of krill *Euphausia superba* abundance applied to FIBEX data [1984, eng] B-30717

Zwally, H.J.
Satellite-derived ice data sets. No. 1: Antarctic monthly average microwave brightness temperatures and sea ice concentrations, 1973-1976 [1981, eng] F-29825
Observing polar-ice variability [1984, eng] F-30485
Concentration gradients and growth/decay characteristics of the seasonal sea ice cover [1984, eng] F-30487
Matrix partitioning and EOF principal component analysis of antarctic sea ice brightness temperatures [1984, eng] F-31068

SUBJECT INDEX

- **Ablation**
  - *See under:* Glacier ice; Ice sheet; Icebergs; Sea ice; Shelf ice; Snow
- **Absorption**
  - *See under:* Ionosphere. *See also:* Cosmic noise absorption; Polar cap absorption
- **Acclimatization**
  - Respiratory metabolism of tick ⌊1982, eng⌋ **B-29034**
  - Low temperature effects on micro-arthropods ⌊1981, eng⌋ **B-29074**
  - Experimental supercooling in two micro-arthropods ⌊1983, eng⌋ **B-29314**
  - Protein synthesis in nototheniids and icefish ⌊1983, eng⌋ **B-29327**
  - Antifreeze glycopeptides of antarctic fishes ⌊1983, eng⌋ **B-29328**
  - Biological antifreezes in *Harpagifer antarcticus* ⌊1983, spa⌋ **B-29483**
  - Antifree accumulation patterns in insects ⌊1983, eng⌋ **B-29674**
  - Supercooling and winter survival in terrestrial arthropods ⌊1982, eng⌋ **B-29955**
  - Antifreeze agents of terrestrial arthropods ⌊1982, eng⌋ **B-29956**
  - Environmental triggers to cold hardening ⌊1982, eng⌋ **B-29957**
  - Review of freezing tolerance in invertebrates ⌊1982, eng⌋ **B-29958**
  - Biological antifreeze agents in coldwater fishes ⌊1982, eng⌋ **B-29959**
  - Egg temperature and embryo metabolism in procellariiformes ⌊1984, eng⌋ **B-30163**
  - Antifreeze peptides and glycopeptides in polar fishes ⌊1983, eng⌋ **B-30305**
  - Comparative study of invertebrate supercooling at Signy Island ⌊1984, eng⌋ **B-30463**
  - Temperature and metabolism of plankton with a comparison of antarctic and nordic krill ⌊1984, eng⌋ **B-30586**
  - Low temperature effects on micro-arthropods ⌊1984, eng⌋ **B-30657**
  - Ecophysiology of two intertidal mites at South Georgia ⌊1984, eng⌋ **B-30714**
  - Comparative analysis of leucine transport in fish liver ⌊1984, eng⌋ **B-30718**
  - Photosynthesis in diatoms under varying light intensities ⌊1984, fre⌋ **B-30795**
  - Low temperature tolerance of soil arthropods ⌊1983, eng⌋ **B-31065**
  - Endolithic microorganisms in extreme dry environments: analysis of a lithobiontic microbial habitat ⌊1984, eng⌋ **B-31365**
  - Algal taxonomy and ecology on Mt. Erebus ⌊1984, eng⌋ **B-31367**
  - Problem of extremity in the ecology of cryptogamic plants ⌊1984, rus⌋ **B-31464**
  - Adaptive peculiarities of the breeding cycle of some antarctic birds ⌊1984, rus⌋ **B-31567**
  - Environment and adaptation of krill in the Lazarev Sea ⌊1985, rus⌋ **B-31665**
  - Remarkable adaptation of penguins to the cold ⌊1981, fre⌋ **B-31755**
  - Fish antifreeze protein and the freezing and recrystallization of ice ⌊1984, eng⌋ **F-30419**
  - Polar clothing from a thermophysiological viewpoint ⌊1983, ger⌋ **G-30767**
  - Seasonal rhythms and human physiology in polar regions ⌊1982, rus⌋ **H-28981**
  - Normal antibodies and immunoglobulins level in human serum ⌊1983, rus⌋ **H-29188**
  - Human adaptation to conditions in Antarctica ⌊1983, rus⌋ **H-29240**
  - Basic results of studies on human adaptation to antarctic conditions ⌊1983, rus⌋ **H-29660**
  - Arctic Environment—man and the future. Abstracts ⌊1984, eng⌋ **H-29933**

  - Mapping activities in Antarctica ⌊1983, eng⌋ **C-30968**
  - Landsat images of Antarctica ⌊1981, eng⌋ **C-31135**
  - Photogrammetry 1983/84 in western New Schwabenland ⌊1984, ger⌋ **C-31168**

Observation of krill using a camera attached to a kite [1984, jpn] C-31258
Special colour enhancement for three channels having similar radiances [1984, eng] C-31454
Photogrammetry in western New Schwabenland 1983/84 [1985, ger] C-31616
Geological interpretation of satellite images of Antarctica [1983, rus] E-29292
Snow and ice mapping in Antarctica, Iceland and Cape Cod [1983, eng] F-29310

Aerobiology
Anaerobes [1983, spa] B-29142
Air-sea interactions over the Ross Sea in the surface boundary layer [1983, eng] I-30700

Aerosols
Origin of salts in antarctic saline lake waters [1984, eng] E-30925
Ions at ultratrace levels in antarctic snow and ice [1984, eng] F-29705
Use of the method of isotope glaciology for studying nuclear explosion products in Antarctica [1982, eng] F-30059
Data from antarctic ice cores on CO2, climate, aerosols, and changes in ice thickness [1984, eng] F-31103
Ionic balance of antarctic snow: a 10-year detailed record [1984, eng] F-31720
Atmospheric trace elements in antarctic prehistoric ice collected at a coastal ablation area [1984, eng] F-31721
Evidence of the biogenic nuclei involvement in Antarctic coastal clouds [1983, eng] I-29235
Turbidity over the Indian Ocean [1983, eng] I-29268
Spectral extinction measurement by sunphotometer at Showa Station, Antarctica [1983, eng] I-29269
Aitken nuclei sonde with constant expansion ratio [1983, eng] I-29278
Laser radar system for measuring the middle atmosphere [1983, jpn] I-29405
Measurements of aerosol particles over the southwestern Indian Ocean [1983, eng] I-29444
Climate monitoring in Antarctica [1983, rus] I-29648
Microanalysis of an East Antarctic ice core for paleoclimate reconstruction models [1983, eng] I-29726
Properties and origins of aerosol particles in the atmosphere [1983, jpn] I-30175
SAM II measurements of polar stratospheric aerosols [1981, eng] I-30311
Chemistry of precipitation in relation to precipitation type [1982, eng] I-30429
Late-glacial maximum-Holocene atmospheric and ice-thickness changes from Antarctic ice-core studies [1984, eng] I-30481
Particle concentrations at the South Pole, on meteorological and climatological time scale [1984, eng] I-30505
On the interaction of aerosol with meteorology [1984, eng] I-30672
Tracking antarctic winds [1983, eng] I-30697
Air-sea interactions over the Ross Sea in the surface boundary layer [1983, eng] I-30700
Meteorological and aerosol experiments in Antarctica [1983, eng] I-30703
Coniometric dust measurements in Antarctica [1983, ger] I-30768
Soluble and insoluble impurities in Vostok ice core and climatic implications [1984, eng] I-30933
Lower atmosphere of the polar regions [1981, eng] I-31137
Aerosols in the antarctic stratosphere after El Chichon eruption [1985, eng] I-31403
Glaciological trace element investigations at German antarctic stations [1985, ger] I-31612
Ammonia and ammonium concentrations in the antarctic atmosphere [1983, eng] I-31632
Aerosol measurements at four background sites [1983, eng] I-31648
Fluctuations of the subtropical and antarctic convergence zones [1985, eng] J-31093
See also: Particulates

Age determination
See under: Glacier ice; Ice; Ice sheet; Shelf ice. *See also:* Geochronology

Air
See: Atmosphere

Air cargo
See: Cargo operations/Air; Transportation/Air

Air masses
Empirical model of a south polar circulation cell [1982, rus] I-28966
R/V *Polarstern* weather station operation, 1982-1983 [1983, ger] I-29003
External gravity field effects on climate [1983, rus] I-29296
Atmospheric processes over western Antarctica [1980, rus] I-29429
Surface mass transfer and climatic changes [1983, rus] I-29502
Synoptic observations at Molodezhnaya Station [1983, rus] I-29649
Steering of global climate by the polar regions [1983, ger] I-29698
Audible wind-generated shock waves in Antarctica [1984, eng] I-30189
Deuterium as related to water vapor and precipitation at Schirmacher Ponds [1984, eng] I-30452
Surface mass transfer and climatic changes [1983, eng] I-30558
Thermally-forced mean mass circulations in the Southern Hemisphere [1985, eng] I-31709

Aircraft
Polar patrol balloon: I. Balloon system [1984, jpn] A-30623
Polar patrol balloon: II. Observation plan [1984, jpn] A-30624
Radio controlled modern airplane for observing swarms of krill [1978, eng] B-29331
German research aircraft successfully tested [1983, eng] G-29308
German aircraft for Antarctica, Dornier 128 & 228 [1984, eng] G-29864
Safety and survival on polar expeditions [1983, eng] G-30509
U.S. Navy Antarctic development squadron six activities, 1982-1983 [1983, eng] G-30970
Operation of Polar I and Polar II in Antarctica, 1983/84 [1984, ger] G-31166
Aerial measurements of glaciological and geophysical parameters in Antarctica [1984, ger] G-31167
Dakotas in the Antarctic; a study in versatility [1971, eng] G-31438
First direct flight Antarctica-Buenos Aires was made by the Argentine navy [1982, spa] G-31487
Operation Ice Cube [1985, eng] G-31494
Antarctic shuttle [1985, eng] G-31495
Helicopter operations at SANAE Station [1983, eng] G-31531
Antarctic exploration by airplane [1985, ger] G-31729
Feasibility of long duration ballooning in Antarctica [1984, eng] I-31100
See also: Navigation/Air; Transportation/Air

Airfields
Use of snow airfields in Antarctica for determination of accumulation rate and atmospheric precipitation [1985, rus] F-31660
Building of runways for wheeled airplanes in deep snow [1983, rus] G-29657
Antarctic infrastructure and policy of access to the continent [1984, spa] G-31356
Geopolitics of transpolar flights [1982, spa] G-31484
Runway at Rodolfo Marsh Martin Station [1983, eng] G-31533
Landing strip site survey on Greenwich Island [1983, eng] G-31534

Airglow
Hydroxyl rotational temperature measurements [1983, eng] K-28998
Study of oxygen red line in twilight [1984, rus] K-30180

Albatrosses
See: Aves-Procellariiformes

Albedo
Potential impact of snow and ice variations on the heat budget [1982, eng] F-29849
Surface albedo data for climatic modeling [1983, eng] I-28999
Albedo of soot-contaminated snow [1983, eng] I-29101
Ultraviolet radiation at South Pole [1984, eng] I-30417
Earth radiation budget derived from the NIMBUS 7 ERB experiment [1984, eng] I-30504
Influence of the CLIMAP ice sheet on the climate of a general circulation model: implications for the Milankovitch theory [1982, eng] I-31300
See also under: Ice; Ice sheet; Sea ice; Snow

Algae
See: Thallophyta-Algae

Altimetry
Amery Ice Shelf topography from satellite radar altimetry [1983, eng] **C-29601**
Towards an inventory of the great ice sheets [1983, eng] **C-29702**
West Antarctica, the sea-level controlled marine instability [1984, eng] **I-30286**
Temporal variability of the Antarctic Circumpolar Current [1984, eng] **J-30467**
Detailed view of the South Pacific geoid from satellite altimetry [1984, eng] **J-30499**
Animals
See: Arthropoda; Aves; Biogeography/Zoogeography; Bryozoa; Coelenterata; Echinodermata; Ecology/Faunal; Mammalia; Mollusca; Pisces; Plankton/Zooplankton; Porifera; Protozoa; Vermes; Zoology
Anseriformes
See: Aves-Anseriformes
Antarctic Convergence
Distribution of sea birds and water masses in summer [1983, rus] **B-29686**
Some features of the lateral distribution of antarctic krill aggregations [1982, eng] **B-31141**
Water movements and antarctic krill [1984, eng] **B-31[illegible]93**
Deep-sea drilling in the roaring 40's [1973, eng] **E-29903**
Lamprocyrtis and *Stichocorys* lineages: polycystine radiolarian evolution [1982, eng] **E-31305**
Sea ice [1984, eng] **F-30263**
Measurements of aerosol particles over the southwestern Indian Ocean [1983, eng] **I-29444**
Water masses in the southwestern Atlantic [1981, spa] **J-29037**
Some physical characteristics of the Antarctic and western Indian Oceans [1983, eng] **J-29438**
Chemistry of southwestern portion of Indian Ocean [1983, eng] **J-29440**
Fluoride, bromide and iodide contents in southwestern Indian Ocean [1983, eng] **J-29441**
Distribution of trace metals in southwestern Indian Ocean [1983, eng] **J-29443**
Ocean temperature, salinity and turbidity [1983, jpn] **J-30192**
Fluctuations of the subtropical and antarctic convergence zones [1985, eng] **J-31093**
Antarctic Divergence
On the geographic boundary of antarctic krill distribution [1983, eng] **B-29355**
Biogeography of lanternfishes (Myctophidae) south of 30 S [1982, eng] **B-30786**
Distribution of krill clusters in the Pacific [1983, rus] **J-29089**
Chemistry of southwestern portion of Indian Ocean [1983, eng] **J-29440**
Fluoride, bromide and iodide contents in southwestern Indian Ocean [1983, eng] **J-29441**
Calcium, magnesium, sulphate and boron distribution in southwestern Indian Ocean [1983, eng] **J-29442**
Distribution of trace metals in southwestern Indian Ocean [1983, eng] **J-29443**
Ocean temperature, salinity and turbidity [1983, jpn] **J-30192**
Upper layer thermal structure in the Atlantic sector of the southern ocean [1984, eng] **J-30884**
Antarctic Treaty
Antarctica: politico-economical handbook [1982, bul] **A-29226**
Report on consultative meeting on antarctic mineral resources [1983, eng] **A-29309**
Report of the Twelfth Antarctic Treaty Consultative Meeting, Canberra, 1983 [1984, eng] **A-29490**

GEOGRAPHIC DISTRIBUTION
Supercooling and winter survival in terrestrial arthropods [1982, eng] **B-29955**
Cenozoic high latitude heterochroneity of Southern Hemisphere marine faunas [1984, eng] **B-30072**
NUTRITION
Food chain of antarctic marine living resources [1984, eng] **B-30443**
PHYSIOLOGY
Low temperature effects on micro-arthropods [1981, eng] **B-29074**
Experimental supercooling in two micro-arthropods [1983, eng] **B-29314**
Supercooling and winter survival in terrestrial arthropods [1982, eng] **B-29955**
Antifreeze agents of terrestrial arthropods [1982, eng] **B-29956**
Environmental triggers to cold hardening [1982, eng] **B-29957**
Comparative study of invertebrate supercooling at Signy Island [1984, eng] **B-30463**
Low temperature effects on micro-arthropods [1984, eng] **B-30657**
Low temperature tolerance of soil arthropods [1983, eng] **B-31065**
POPULATION
Terrestrial arthropoda of the grasses on Lynch Island [1984, eng] **B-31091**
Arthropod communities in the Signy Island moss-turf habitat [1984, eng] **B-31097**
TAXONOMY
Supercooling and winter survival in terrestrial arthropods [1982, eng] **B-29955**

Arthropoda-Arachnida
Invertebrates collected at the old whaling station, Grytviken, South Georgia [1983, eng] **B-28984**
BEHAVIOR
Predation by the antarctic mite *Gamasellus racovitzai* [1984, eng] **B-30559**
ECOLOGY
Hyadesia maxima sp. n. (Acari, Hyadesiidae) from South Georgia [1983, eng] **B-30617**
Arthropod communities in a maritime antarctic moss-turf habitat [1984, eng] **B-30713**
Ecophysiology of two intertidal mites at South Georgia [1984, eng] **B-30714**
Mites around Showa Station [1984, jpn] **B-31398**
GEOGRAPHIC DISTRIBUTION
New species of *Austrodecidae (Pantopoda)* from the Antarctic [1977, rus] **B-29027**
Mites of Antarctica and the Subantarctic Islands [1984, eng] **B-29910**
Mites around Showa Station [1984, jpn] **B-31398**
MORPHOLOGY
New species of *Austrodecidae (Pantopoda)* from the Antarctic [1977, rus] **B-29027**
Life-stages of prostigmatid mite [1983, eng] **B-29061**
New species of mite in the genus *Nanorchestes* from Signy Island [1984, eng] **B-30117**
Hyadesia maxima sp. n. (Acari, Hyadesiidae) from South Georgia [1983, eng] **B-30617**
NUTRITION
Predation by the antarctic mite *Gamasellus racovitzai* [1984, eng] **B-30559**
PHYSIOLOGY
Respiratory metabolism of tick [1982, eng] **B-29034**
Ecophysiology of two intertidal mites at South Georgia [1984, eng] **B-30714**
POPULATION
Organization of soil arthropod communities [1983, eng] **B-29049**
Reindeer effects on the flora and invertebrate fauna of South Georgia [1984, eng] **B-30550**
Mites around Showa Station [1984, jpn] **B-31398**
TAXONOMY
Mites of Antarctica and the Subantarctic Islands [1984, eng] **B-29910**
New species of mite in the genus *Nanorchestes* from Signy Island [1984, eng] **B-30117**
Hyadesia maxima sp. n. (Acari, Hyadesiidae) from South Georgia [1983, eng] **B-30617**

Arthropoda-Crustacea
Short-term variability of phytoplankton off Balleny Islands [1982, rus] **B-28980**
Fourth BIOMASS progress report [1983, eng] **B-28986**
Euphausiacea [1981, spa] **B-29039**
BIOMASS program implementation and coordination meeting [1982, eng] **B-29190**
Report of the third meeting [1980, eng] **B-29251**
Report on the BIOMASS Data Workshop [1980, eng] **B-29254**
Seminar on krill biology, Bremerhaven, May 1983 [1983, eng] **B-29339**
Geographical aspects of the life history of *Euphausia superba* [1983, eng] **B-29343**
Understanding antarctic larval euphausiids [1983, eng] **B-29344**
Stomach contents in fish from Lützow-Holm Bay [1982, eng] **B-29384**
Minke whales of the antarctic portion of the Indian Ocean compared with those off Durban [1982, eng] **B-29778**
Comparison of marine soft-bottom communities in California and Antarctica [1980, eng] **B-29807**
Antarctic krill—biology, ecology, and distribution [1984, eng] **B-29941**
Krill population off South Georgia in autumn [1984, eng] **B-29949**
Features of the microelement composition of antarctic krill [1984, eng] **B-29950**
Research at the Marine Fisheries Institute in Antarctica [1981, pol] **B-29982**
Life cycle of *Branchinecta gaini* on King George Island [1983, eng] **B-30347**
Littoral and benthic fauna of King George Island [1984, ger] **B-30748**
Survey of antarctic zooplankton [1984, eng] **B-30984**
Pelagic ecosystems of the southern ocean [1985, rus] **B-31080**
Proceedings: Biology of the antarctic krill *Euphausia superba* [1984, eng] **B-31191**
Biology of the antarctic krill: what are the fundamental hypotheses [1984, eng] **B-31192**
Whales of the Antarctic [1984, spa] **B-31250**
Report on SIBEX and fish stock investigations [1984, ger] **B-31302**

Arthropoda-Crustacea *(cont.)*
Fauna and distribution of crustaceans in notalian and antarctic waters [1982, rus] **B-31312**
Bythocytheridae ostracodes and ontogeny of the Sclerochilini tribe [1982, rus] **B-31313**
Clawed Asellus (Crustacea, Tanaidacea) from antarctic and subantarctic shelves [1982, rus] **B-31314**
Four new species of isopod crustaceans of the genus *Acanthaspidia* [1982, rus] **B-31315**
Isopod crustaceans from antarctic shelves, 1965-1968 [1982, rus] **B-31316**
Krill—key link in the antarctic food chain [1984, ger] **B-31324**
Lipid, sterol and fatty acid composition of antarctic krill *(Euphausia superba* Dana) [1984, eng] **B-31444**
Antarctic research cruise [1985, eng] **B-31604**
Distribution and seasonal peculiarities of plankton in the Amundsen Sea [1985, rus] **B-31664**
Environment and adaptation of krill in the Lazarev Sea [1985, rus] **B-31665**
Ostracoda from Vestfold Hills lake terraces [1984, eng] **E-30994**
Early Paleozoic ostracoda of the Atlantic margin, other than eastern Canada [1977, eng] **E-31307**
Census of Holocene species of *Xestoleberis* (Ostracoda, Podocopida) from the southern oceans [1972, eng] **E-31388**
First Post-FIBEX Hydrographic Data Interpretation Workshop [1982, eng] **J-29191**
Second Post-FIBEX Hydrographic Data Interpretation Workshop [1983, eng] **J-29192**
Antarctic circumpolar ocean [1984, eng] **J-31435**
BEHAVIOR
Swimming and energy balance in antarctic krill [1981, eng] **B-29045**
Krill swarms and life cycle in the southern ocean [1983, eng] **B-29340**
Development of an energy budget for *Euphausia superba* [1983, eng] **B-29348**
Estimation of krill abundance [1983, eng] **B-29352**
Distribution of krill in Bransfield Strait [1983, eng] **B-29353**
Aggregation of krill as an adaptive group strategy [1983, eng] **B-29354**
On the geographic boundary of antarctic krill distribution [1983, eng] **B-29355**
Krill—untapped bounty from the sea [1984, eng] **B-29661**
Cannibalism in *Euphausia superba* Dana [1982, eng] **B-30174**
Feeding of krill around South Georgia at different depth and time of day [1984, eng] **B-30422**
Laboratory observation of krill larval development [1984, eng] **B-30423**
Swarm of crustaceans under Showa's sea ice [1984, eng] **B-30619**
Acoustic characterization of krill swarms [1984, eng] **B-31194**
Structures of swarming and dispersed krill populations [1984, eng] **B-31195**
Aspects of schooling in *Euphausia superba* [1984, eng] **B-31196**
Structure and composition of large krill swarms [1984, eng] **B-31197**
Composition of krill schools west of the Antarctic Peninsula [1984, eng] **B-31198**
Size frequency pattern of krill in Bransfield Strait [1984, eng] **B-31199**
Krill swarming and feeding north of Elephant Island [1984, eng] **B-31201**
Feeding requirements of krill in relation to food sources [1984, eng] **B-31202**
Filtration rates in krill [1984, eng] **B-31204**
Vertical distribution of krill larvae in the Scotia Sea [1984, eng] **B-31208**
Fur seal diving behavior in relation to vertical distribution of krill [1985, eng] **B-31446**
BREEDING CYCLES AND REPRODUCTION
Life span of krill derived from population size structure in the Indian Ocean [1983, rus] **B-29093**
Krill biology and distribution in the Lazarev Sea [1983, rus] **B-29094**
Spawning frequency and fecundity of krill [1983, eng] **B-29147**
Breeding structure in antarctic krill [1983, eng] **B-29357**
Population genetics of krill and comparison with other marine organisms [1983, eng] **B-29358**
Study of krill early development [1982, eng] **B-29381**
Krill in the southern Weddell Sea [1982, eng] **B-29664**
Secretion of spermatophores in krill [1981, rus] **B-30792**
Paralabidocera antarctica occurrence and age composition at Showa Station [1984, eng] **B-30894**
Chromosomes of *Euphausia superba* Dana [1984, eng] **B-31184**
Water movements and antarctic krill [1984, eng] **B-31193**
Sinking speed, density and size of Euphausiid eggs [1983, eng] **B-31700**
Reproductive biology of an antarctic shrimp [1983, eng] **B-31751**
ECOLOGY
Krill in the Scotia Sea [1983, rus] **B-29091**
Ecology and geographic distribution of krill [1982, eng] **B-29375**
Level of predation on antarctic krill by its main consumers [1984, eng] **B-29952**
Korean report on krill research [1983, eng] **B-29954**
Euphausiacea distribution in Drake Passage and Bransfield Strait [1983, eng] **B-30336**
Copepoda (Calanoida) from Prydz Bay [1983, eng] **B-30338**
Feeding of krill around South Georgia at different depth and time of day [1984, eng] **B-30422**
Chemical and biological characteristics of fecal pellets of krill [1984, eng] **B-30895**
Some features of the lateral distribution of antarctic krill aggregations [1982, eng] **B-31141**
Ontogenetic adaptations in krill growth and respiration [1984, eng] **B-31209**
Ecophysiology of a planktonic crustacean from Kerguelen [1983, eng] **B-31748**
Distribution of krill clusters in the Pacific [1983, rus] **J-29089**
Investigation of origin of krill found off South Georgia [1983, rus] **J-29090**
EMBRYOLOGY
Seasonal plankton succession in coastal waters of the Antarctic Peninsula [1982, rus] **B-28976**
Sinking speed of krill eggs and timing of early life history stages [1983, eng] **B-29345**
Development of eggs and nauplii of *Euphausia superba* [1984, eng] **B-29718**
Krill embryo depth distribution from sinking rates [1984, eng] **B-30076**
Laboratory observation of krill larval development [1984, eng] **B-30423**
Larval growth and hatching under pressure of eggs of *Euphausia superba* [1983, eng] **B-30677**
Field and laboratory studies of antarctic krill, austral summer 1982-83 [1983, eng] **B-30678**
Ontogenetic adaptations in krill growth and respiration [1984, eng] **B-31209**
Metabolism, chemical content, and food requirements in krill [1984, eng] **B-31211**
Sinking speed, density and size of Euphausiid eggs [1983, eng] **B-31700**
EXPLOITATION
Economics of the resources of Antarctica [1982, eng] **A-30050**
Processing krill into food products [1981, ger] **A-30060**
Antarctic fisheries: history and prospects [1984, eng] **A-30599**

Actomyosin biochemistry in krill [1981, jpn] **B-29326**
Midwater trawl for krill distribution research [1978, eng] **B-29329**
Experiment with fish pump for catching krill [1978, eng] **B-29330**
Radio controlled modern airplane for observing swarms of krill [1978, eng] **B-29331**

SUBJECT INDEX

Autolysis of antarctic krill protein ⌈1978, eng⌉ **B-29332**
Freezing and defrosting of krill ⌈1978, eng⌉ **B-29333**
Movement of large swarms of krill off Enderby Land ⌈1982, eng⌉ **B-29334**
Frozen krill storage ⌈1982, eng⌉ **B-29335**
Use of krill meal in feeding calves ⌈1981, pol⌉ **B-29366**
Effect of krill meal in pig feed ration on the performance and carcass traits ⌈1981, pol⌉ **B-29367**
Effect of krill meal feed on pig meat quality, backfat characteristics and blood plasma constituents ⌈1981, pol⌉ **B-29368**
Krill meal feed effect on nutrient digestibility and nitrogen balance in piglets ⌈1981, pol⌉ **B-29369**
Using krill meal in rabbit fattening ⌈1981, pol⌉ **B-29370**
Krill meal feed effect in weaned piglets from 4 to 9 weeks old ⌈1981, pol⌉ **B-29371**
Effect of krill meal feed on calf fattening and resulting beef quality ⌈1981, pol⌉ **B-29373**
Krill—untapped bounty from the sea ⌈1984, eng⌉ **B-29661**
Management of marine mammals ⌈1981, eng⌉ **B-29677**
Antarctic arguments and options ⌈1981, eng⌉ **B-29682**
On the joint exploitation of krill and whales ⌈1981, eng⌉ **B-29683**
Growth and energy budgets of large baleen whales from the Southern Hemisphere ⌈1981, eng⌉ **B-29684**
Status of the antarctic fur seal, *Arctocephalus gazella* ⌈1982, eng⌉ **B-29711**
Ecological studies of pygoscelid penguins and antarctic skuas ⌈1981, eng⌉ **B-29874**
Deterioration of krill muscle during freeze storage ⌈1983, eng⌉ **B-29878**
Korean report on krill research ⌈1983, eng⌉ **B-29954**
Indirect indicators of changes in krill availability applied to pinnipeds and seabirds ⌈1983, eng⌉ **B-29960**
Methods for technological development of meal production from antarctic krill ⌈1982, pol⌉ **B-30073**
Industrial exploitation of antarctic krill ⌈1982, pol⌉ **B-30074**
Krill stock research in the BIOMASS program ⌈1982, pol⌉ **B-30075**
Krill and its utilization: a review ⌈1983, eng⌉ **B-30078**
Characteristics of krill eaten by fur seals ⌈1984, eng⌉ **B-30118**
Supplementation of various meals to fish meal diet for chum salmon fry ⌈1984, eng⌉ **B-30141**
Hydroacoustic and midwater trawling survey of Prince Edward Islands ⌈1982, eng⌉ **B-30166**
Hydroacoustic and midwater trawling survey of Gough Island ⌈1982, eng⌉ **B-30168**
Extraction of protein from antarctic krill, Part 3 ⌈1982, eng⌉ **B-30270**
Changes in cooked odor of antarctic krill during frozen storage ⌈1984, eng⌉ **B-30278**
Characterization of the mineral compositon of isolated krill proteins ⌈1983, eng⌉ **B-30297**
Myofibrillar proteins in freezing and thawing of krill ⌈1984, eng⌉ **B-30299**
Nutritive value of antarctic krill ⌈1981, eng⌉ **B-30335**
Whole body krill meal and non-muscle krill meal in fish diet ⌈1984, eng⌉ **B-30371**
Effects on fish growth of growth promoting fractions of non-muscle krill meal ⌈1984, eng⌉ **B-30372**
Visceral skeleton changes in pelagic *Notothenia* ⌈1982, rus⌉ **B-30378**
Effect of storage and handling on fatty acid composition of krill ⌈1984, rus⌉ **B-30433**
Astaxanthin content of silver salmon *(Oncorhynchus kisulch)* ⌈1983, jpn⌉ **B-30551**
Utilization of *Euphausia superba* ⌈1982, jpn⌉ **B-30610**
Utilization of *Euphausia superba* ⌈1982, jpn⌉ **B-30611**
Study of muscular proteins in krill for human consumption ⌈1983, jpn⌉ **B-30612**
Net filtering properties in krill fishing ⌈1983, rus⌉ **B-30615**
Products from krill meat ⌈1983, rus⌉ **B-30616**
Acoustic estimation of krill abundance ⌈1984, eng⌉ **B-30717**

Arthropoda-Crustacea

GEOGRAPHIC DISTRIBUTION *(cont.)*

Euphausiacea distribution in Drake Passage and Bransfield Strait [1983, eng] **B-30336**
Copepoda (Calanoida) from Prydz Bay [1983, eng] **B-30338**
FIBEX cruise zooplankton data [1984, eng] **B-30431**
Swarm of crustaceans under Showa's sea ice [1984, eng] **B-30619**
Some features of the lateral distribution of antarctic krill aggregations [1982, eng] **B-31141**
Water movements and antarctic krill [1984, eng] **B-31193**
Structure and composition of large krill swarms [1984, eng] **B-31197**
Composition of krill schools west of the Antarctic Peninsula [1984, eng] **B-31198**
Size frequency pattern of krill in Bransfield Strait [1984, eng] **B-31199**
Krill swarming and feeding north of Elephant Island [1984, eng] **B-31201**
Respiration and excretion in krill swarms related to distribution [1984, eng] **B-31203**
Energy flow through krill swarms [1984, eng] **B-31205**
Development and growth in krill larvae [1984, eng] **B-31207**
Large-scale hydrography and krill distribution in the southern ocean [1984, eng] **B-31214**
Zoogeographic partition of the southern Pacific surface waters by macroplankton [1982, rus] **B-31317**
Euphausiid larvae in plankton samples [1985, eng] **B-31327**
Geographic distribution of macrozooplankton: Bransfield Strait and Scotia Sea [1985, eng] **B-31328**
Water masses, bottom topography and krill distribution [1984, eng] **B-31697**
Occurrence and distribution of the antarctic copepods along the ice shelves in the Weddell Sea in summer 1979-1980 [1983, eng] **B-31702**
Genetic variations in Kerguelen benthic invertebrates [1983, eng] **B-31753**
Observation of krill using a camera attached to a kite [1984, jpn] **C-31258**
Antarctica, Africa, Australia—Mesozoic Conchostracan dispersal [1983, eng] **E-30386**
Investigation of origin of krill found off South Georgia [1983, rus] **J-29090**
Hydrology of Bransfield Strait and krill distribution [1983, rus] **J-29092**
Policies of mineral resource development [1984, eng] **M-29259**

LOCOMOTION

Swimming and energy balance in antarctic krill [1981, eng] **B-29045**
Swimming and feeding of antarctic krill [1983, eng] **B-29351**

MIGRATION

Ontogenetic migration of antarctic Euphausiids [1982, rus] **B-28977**
Movement of large swarms of krill off Enderby Land [1982, eng] **B-29334**
Aggregation of krill as an adaptive group strategy [1983, eng] **B-29354**
On the geographic boundary of antarctic krill distribution [1983, eng] **B-29355**
Four new stocks of Lithodids in southwestern Indian Ocean [1982, eng] **B-29710**
Biocenological aspects of exploiting krill [1984, eng] **B-30739**
Aspects of schooling in *Euphausia superba* [1984, eng] **B-31196**
Vertical distribution of krill larvae in the Scotia Sea [1984, eng] **B-31208**

MORPHOLOGY

Morphology and taxonomy of freshwater copepods on South Shetland Islands [1983, spa] **B-29159**
Calanoid copepods of some scolecithricid genera [1983, eng] **B-29320**
Amphipoda from the Southern Ocean [1983, eng] **B-29321**
Eggs and larvae of two krill species [1983, eng] **B-29342**
Sinking speed of krill eggs and timing of early life history stages [1983, eng] **B-29345**
Moulting and moult physiology in krill [1983, eng] **B-29346**
Estimation of krill abundance [1983, eng] **B-29352**
Krill—untapped bounty from the sea [1984, eng] **B-29661**
Distribution of euphausiid larvae in the southern Weddell Sea [1982, eng] **B-29665**
Development of eggs and nauplii of *Euphausia superba* [1984, eng] **B-29718**
Guide to the Decapoda of the southern ocean [1984, eng] **B-29815**
Thymopides grobovi (Decapoda, Crustacea, Nephropidae) off Kerguelen Islands [1979, fre] **B-29852**
Isopoda and Gnathiida off Kerguelen Islands [1980, eng] **B-29853**
Amphipods of waters around subantarctic islands [1983, eng] **B-29921**
Amphipod from subantarctic waters south of Australia and New Zealand [1983, eng] **B-29922**
Taxonomy and morphology of a Ross Sea crustacean [1983, eng] **B-29923**
Korean report on krill research [1983, eng] **B-29954**
Cyllopus Dana (Amphipoda: Hyperiidea) taxonomy and distribution [1983, ger] **B-30204**
Laboratory observation of krill larval development [1984, eng] **B-30423**
New harpacticoid copepods (Tisbidae), parasites of octopuses in the Ross Sea [1983, rus] **B-30593**
Secretion of spermatophores in krill [1981, rus] **B-30792**
Biotic and physical environmental impact on genetic variation in krill [1984, eng] **B-31206**
Development and growth in krill larvae [1984, eng] **B-31207**
Vertical distribution of krill larvae in the Scotia Sea [1984, eng] **B-31208**
Ontogenetic adaptations in krill growth and respiration [1984, eng] **B-31209**
Ammonia excretion in krill during developmental stages [1984, eng] **B-31210**
Lipid content and composition of antarctic krill [1984, eng] **B-31212**
Assessment of longevity in antarctic krill [1984, eng] **B-31213**
New species of the genus *Pycnogonum* (Pantopoda) from the Antarctic [1984, rus] **B-31223**
Redescription of Schellenberg's types of *Lysianopsis subantarctica* and *Paralysianopsis odhneri* (Amphipoda, Lysianassidae) [1984, eng] **B-31334**
ADBEX II Cruise krill/zooplankton sampling data [1984, eng] **B-31371**
Genetic variations in Kerguelen benthic invertebrates [1983, eng] **B-31753**

NUTRITION

Nutrition balance in krill [1983, rus] **B-29095**
Moulting and moult physiology in krill [1983, eng] **B-29346**
Particulate matter and nutritional processes of krill [1983, eng] **B-29347**
Biochemistry of *Euphausia superba* [1983, eng] **B-29350**
Swimming and feeding of antarctic krill [1983, eng] **B-29351**
Epipelagic copepods of Calanoida in the Indian Ocean [1982, eng] **B-29379**
Cannibalism in *Euphausia superba* Dana [1982, eng] **B-30174**
Feeding of krill around South Georgia at different depth and time of day [1984, eng] **B-30422**
Laboratory observation of krill larval development [1984, eng] **B-30423**
Choanoflagellates in the antarctic ocean [1984, eng] **B-30889**
Diatom distribution in the Indian Ocean [1984, eng] **B-30891**
Chemical and biological characteristics of fecal pellets of krill [1984, eng] **B-30895**
Feeding and moulting of krill in winter [1984, eng] **B-31118**
Feeding of antarctic krill *Euphausia superba* [1984, eng] **B-31200**
Krill swarming and feeding north of Elephant Island [1984, eng] **B-31201**
Feeding requirements of krill in relation to food sources [1984, eng] **B-31202**
Filtration rates in krill [1984, eng] **B-31204**
Metabolism, chemical content, and food requirements in krill [1984, eng] **B-31211**
Food ration and its components in antarctic krill [1983, eng] **B-31332**
Krill food supply and phytophaga in Scotia Sea [1985, rus] **B-31666**
Utilization of phytoplankton by antarctic copepods [1983, eng] **B-31746**

PATHOLOGY

Distribution of fluoride within krill bodies [1983, eng] **B-29508**

Nutritive value of antarctic krill [1981, eng] B-30335
Fate of DDTs, PCBs and chlordane compounds in the antarctic marine ecosystem [1984, eng] B-30905

PHYSIOLOGY
Swimming and energy balance in antarctic krill [1981, eng] B-29045
Distribution of imino acids in krill [1982, eng] B-29054
Environment and distribution of krill [1983, rus] B-29081
Nutrition balance in krill [1983, rus] B-29095
Lipid decomposition properties in krill [1981, eng] B-29324
Actomyosin biochemistry in krill [1981, jpn] B-29326
Autolysis of antarctic krill protein [1978, eng] B-29332
Freezing and defrosting of krill [1978, eng] B-29333
Krill tRNA chemical structure and thermal properties [1981, eng] B-29336
Moulting and moult physiology in krill [1983, eng] B-29346
Particulate matter and nutritional processes of krill [1983, eng] B-29347
Development of an energy budget for *Euphausia superba* [1983, eng] B-29348
Ecological physiology of krill [1983, eng] B-29349
Population genetics of krill and comparison with other marine organisms [1983, eng] B-29358
Automatic ion-exchange chromatography of di- and monosaccharides [1981, pol] B-29372
Respiration rates of some antarctic isopods [1984, eng] B-29397
Uptake of Sr-90 and Y-90 by antarctic krill [1983, eng] B-29477
Autolysis in frozen krill related to storage temperature [1983, ger] B-29510
Krill—untapped bounty from the sea [1984, eng] B-29661
Digestibility of actomyosin in krill [1983, jpn] B-29812
Deterioration of krill muscle during freeze storage [1983, eng] B-29878
Oxygen metabolism and bioenergetic demands of antarctic krill [1984, eng] B-29951
Methods for technological development of meal production from antarctic krill [1982, pol] B-30073
Lipid content and composition of some antarctic macrozooplankton [1984, eng] B-30115
Extraction of protein from antarctic krill, Part 3 [1982, eng] B-30270
Feeding of krill around South Georgia at different depth and time of day [1984, eng] B-30422
Laboratory observation of krill larval development [1984, eng] B-30423
Effect of storage and handling on fatty acid composition of krill [1984, rus] B-30433
Lipid composition of two species of *Serolis* [1984, eng] B-30460
Temperature and metabolism of plankton with a comparison of antarctic and nordic krill [1984, eng] B-30586
Utilization of *Euphausia superba* [1982, jpn] B-30610
Utilization of *Euphausia superba* [1982, jpn] B-30611
Study of muscular proteins in krill for human consumption [1983, jpn] B-30612
Effects of protease inhibitors on antarctic krill [1984, eng] B-30626
Larval growth and hatching under pressure of eggs of *Euphausia superba* [1983, eng] B-30677
Field and laboratory studies of antarctic krill, austral summer 1982-83 [1983, eng] B-30678
Freshness of krill and muscular protein extractability [1983, jpn] B-30769
Krill fresh muscle deterioration from tissue contamination [1983, jpn] B-30770
Composition of carotenoid pigments in krill [1983, jpn] B-30771
Stability of carotenoid pigments in krill [1983, jpn] B-30772
Elution profile of muscular protein from antarctic krill in sepharose Cl-4B gel filtration [1983, jpn] B-30773
Physiochemical and biochemical changes in krill muscular proteins at low temperature storage [1983, jpn] B-30775
Separation of myofibrils from antarctic krill muscle and properties of gel obtained by heating [1983, jpn] B-30777
Carotenoproteins in krill [1984, eng] B-30785
Krill lifespan revised [1984, eng] B-30818
Chemical and biological characteristics of fecal pellets of krill [1984, eng] B-30895
Rearing of antarctic marine organisms in Japan [1984, eng] B-30898
Classification of proteases in antarctic krill [1983, eng] B-31053
Feeding and moulting of krill in winter [1984, eng] B-31118
Chromosomes of *Euphausia superba* Dana [1984, eng] B-31184
Feeding of antarctic krill *Euphausia superba* [1984, eng] B-31200
Feeding requirements of krill in relation to food sources [1984, eng] B-31202
Respiration and excretion in krill swarms related to distribution [1984, eng] B-31203
Filtration rates in krill [1984, eng] B-31204
Energy flow through krill swarms [1984, eng] B-31205
Biotic and physical environmental impact on genetic variation in krill [1984, eng] B-31206
Ontogenetic adaptations in krill growth and respiration [1984, eng] B-31209
Ammonia excretion in krill during developmental stages [1984, eng] B-31210
Metabolism, chemical content, and food requirements in krill [1984, eng] B-31211
Food ration and its components in antarctic krill [1983, eng] B-31332
ADBEX II Cruise krill/zooplankton sampling data [1984, eng] B-31371
Partial purification and some properties of protease from antarctic krill [1984, eng] B-31387
Metabolizable energies of dry boiled krill *(Euphausia superba)* for chickens [1983, jpn] B-31576
Molt cycle of krill in the laboratory [1984, eng] B-31699
Sterols and fluoride in krill [1984, fre] B-31723
Ecophysiology of a planktonic crustacean from Kerguelen [1983, eng] B-31748
Metabolic adaptations of antarctic zooplanktons [1983, eng] B-31749
Reproductive biology of an antarctic shrimp [1983, eng] B-31751
Migration of fluoride from the shell to the flesh of krill [1983, ger] E-29509

POPULATION
Environment and distribution of krill [1983, rus] B-29081
Population of antarctic mass species of copepods in the Lazarev Sea [1983, rus] B-29086
Conditions for krill clusters in the Lazarev Sea [1983, rus] B-29088
Krill in the Scotia Sea [1983, rus] B-29091
Life span of krill derived from population size structure in the Indian Ocean [1983, rus] B-29093
Krill biology and distribution in the Lazarev Sea [1983, rus] B-29094
FIBEX implementation and coordination [1980, eng] B-29253
Movement of large swarms of krill off Enderby Land [1982, eng] B-29334
Krill swarms and life cycle in the southern ocean [1983, eng] B-29340
Distribution and abundance of krill larvae [1983, eng] B-29341
Eggs and larvae of two krill species [1983, eng] B-29342
Ecological physiology of krill [1983, eng] B-29349
Estimation of krill abundance [1983, eng] B-29352
Distribution of krill in Bransfield Strait [1983, eng] B-29353
Krill populations in Bransfield Strait [1983, eng] B-29356
Breeding structure in antarctic krill [1983, eng] B-29357
Population genetics of krill and comparison with other marine organisms [1983, eng] B-29358
Epipelagic copepods of Calanoida in the Indian Ocean [1982, eng] B-29379
Zooplankton community off South Georgia in the summer of 1973 [1982, eng] B-29380
Zooplankton of the antarctic waters [1983, eng] B-29459
Krill in the southern Weddell Sea [1982, eng] B-29664
Population composition of krill *Euphausia superba* Dana [1984, eng] B-29947
Krill concentrations in the southern ocean [1984, eng] B-29948
Assessment of krill biomass from a net sampling program [1982, eng] B-30314
Relation of phytoplankton abundance in antarctic waters to environments [1982, eng] B-30315
Copepoda (Calanoida) from Prydz Bay [1983, eng] B-30338
Nototheniidae among krill off Balleny Islands [1983, eng] B-30340
Superswarms of antarctic krill *(Euphausia superba* Dana) [1983, eng] B-30674

Arthropoda-Crustacea
POPULATION *(cont.)*
Antarctic krill *(Euphausia superba)* swarms from Elephant Island [1983, eng] **B-30675**
Zooplankton associated with superswarms of antarctic krill [1983, eng] **B-30676**
Acoustic estimation of krill abundance [1984, eng] **B-30717**
Biomass of krill in the eastern part of Bransfield Strait, March 1981 [1984, eng] **B-30782**
Paralabidocera antarctica occurrence and age composition at Showa Station [1984, eng] **B-30894**
Distribution of carnivorous invertebrates in Lützow-Holm Bay [1984, eng] **B-30899**
Acoustic characterization of krill swarms [1984, eng] **B-31194**
Structures of swarming and dispersed krill populations [1984, eng] **B-31195**
Structure and composition of large krill swarms [1984, eng] **B-31197**
Composition of krill schools west of the Antarctic Peninsula [1984, eng] **B-31198**
Size frequency pattern of krill in Bransfield Strait [1984, eng] **B-31199**
Respiration and excretion in krill swarms related to distribution [1984, eng] **B-31203**
Energy flow through krill swarms [1984, eng] **B-31205**
Biotic and physical environmental impact on genetic variation in krill [1984, eng] **B-31206**
Development and growth in krill larvae [1984, eng] **B-31207**
Euphausiid larvae in plankton samples [1985, eng] **B-31327**
Geographic distribution of macrozooplankton: Bransfield Strait and Scotia Sea [1985, eng] **B-31328**
Biomass and production of antarctic krill *(Euphausia superba* Dana) [1983, eng] **B-31333**
Water masses, bottom topography and krill distribution [1984, eng] **B-31697**
Occurrence and distribution of the antarctic copepods along the ice shelves in the Weddell Sea in summer 1979-1980 [1983, eng] **B-31702**
TAXONOMY
Analysis of plankton organisms on *Orcadas 05-75* [1983, spa] **B-29143**
Morphology and taxonomy of freshwater copepods on South Shetland Islands [1983, spa] **B-29159**
Calanoid copepods of some scolecithricid genera [1983, eng] **B-29320**
Amphipoda from the Southern Ocean [1983, eng] **B-29321**
Epipelagic copepods of Calanoida in the Indian Ocean [1982, eng] **B-29379**
Zooplankton community off South Georgia in the summer of 1973 [1982, eng] **B-29380**
Zooplankton of the antarctic waters [1983, eng] **B-29459**
Taxonomic revisions of some antarctic and subantarctic amphipods [1983, eng] **B-29706**
Four new stocks of Lithodids in southwestern Indian Ocean [1982, eng] **B-29710**
Guide to the Decapoda of the southern ocean [1984, eng] **B-29815**
Thymopides grobovi (Decapoda, Crustacea, Nephropidae) off Kerguelen Islands [1979, fre] **B-29852**
Isopoda and Gnathiida off Kerguelen Islands [1980, eng] **B-29853**
Amphipods of waters around subantarctic islands [1983, eng] **B-29921**
Amphipod from subantarctic waters south of Australia and New Zealand [1983, eng] **B-29922**
Taxonomy and morphology of a Ross Sea crustacean [1983, eng] **B-29923**
Cyllopus Dana (Amphipoda: Hyperiidea) taxonomy and distribution [1983, ger] **B-30204**
Redescription of Schellenberg's types of *Lysianopsis subantarctica* and *Paralysianopsis odhneri* (Amphipoda, Lysianassidae) [1984, eng] **B-31334**
Bathyal crabs from Reunion Island: Description of *Cyrtomaia guillei* sp. nov., *:Platypilumnus inermis* sp. nov., and *Psopheticus vocans* sp. nov. (Crustacea Decapoda Brachyura) [1984, fre] **B-31504**
Cruise MD 32 of the *Marion Dufresne* to Reunion Island. Portunidae (Crustacea Decapoda Brachyura) [1984, fre] **B-31505**
Notes on stomatopod crustacea from La Réunion and Mauritius [1984, eng] **B-31506**
Occurrence and distribution of the antarctic copepods along the ice shelves in the Weddell Sea in summer 1979-1980 [1983, eng] **B-31702**

Arthropoda-Insecta
Invertebrates collected at the old whaling station, Grytviken, South Georgia [1983, eng] **B-28984**
Predation by the antarctic mite *Gamasellus racovitzai* [1984, eng] **B-30559**
BEHAVIOR
Predation of an insect larva on Marion Island [1983, eng] **B-30840**
ECOLOGY
Antifree accumulation patterns in insects [1983, eng] **B-29674**
Arthropod communities in a maritime antarctic moss-turf habitat [1984, eng] **B-30713**
Parthenogenetic midge on South Georgia [1985, eng] **B-31582**
EVOLUTION
Life cycle strategies in two antarctic Collembola [1984, eng] **B-31090**
GEOGRAPHIC DISTRIBUTION
Insect life in Antarctica [1978, nor] **B-30728**
NUTRITION
Energy partitioning in the antarctic collembolan *Cryptopygus antarcticus* [1984, eng] **B-30165**
Life cycle strategies in two antarctic Collembola [1984, eng] **B-31090**
PHYSIOLOGY
Energy partitioning in the antarctic collembolan *Cryptopygus antarcticus* [1984, eng] **B-30165**
Life cycle strategies in two antarctic Collembola [1984, eng] **B-31090**
POPULATION
Organization of soil arthropod communities [1983, eng] **B-29049**
Reindeer effects on the flora and invertebrate fauna of South Georgia [1984, eng] **B-30550**
Parthenogenetic midge on South Georgia [1985, eng] **B-31582**
TAXONOMY
Parthenogenetic midge on South Georgia [1985, eng] **B-31582**

Atmosphere
Proposed program for antarctic climate research [1983, eng] **A-29239**
Ocean [1983, eng] **F-29876**
Soviet meteorological investigations in Antarctica [1983, rus] **I-29187**
Spectroscopic measurements of the "additional absorbing mass" in total and partial cloudiness [1983, rus] **I-29189**
Atmospheric processes over western Antarctica [1980, rus] **I-29429**
Climate monitoring in Antarctica [1983, rus] **I-29648**
Final progress report for Contract F49620-81-C-0091 [1982, eng] **I-29856**
Meteorological research in the Arctic and Antarctic during the Soviet years [1978, eng] **I-30054**
Climate: ocean and atmosphere interaction in the Southern Hemisphere [1984, eng] **I-30069**
State and prospects of meteorological research in the Antarctic [1984, eng] **I-30635**
Lower atmosphere of the polar regions [1981, eng] **I-31137**
Response of a climate model to orbital variations [1982, eng] **I-31299**
Radiative model of the stable nocturnal boundary layer with application to the polar night [1984, eng] **I-31587**
Current status and problems of southern ocean studies [1983, rus] **J-29650**

Measurements of CO2 in the atmosphere over Showa Station [1984, jpn] **I-30618**
Tracking antarctic winds [1983, eng] **I-30697**
Air-sea interactions over the Ross Sea in the surface boundary layer [1983, eng] **I-30700**
Antarctic hydroxyl radical measurements [1983, eng] **I-30701**
Rare trace gases at the South Pole [1983, eng] **I-30705**
Measurement of the column densities of water and trace gases [1983, eng] **I-30706**
Air chemistry monitoring at Palmer Station [1983, eng] **I-30707**
Measurements of atmospheric carbon dioxide over the ocean [1984, rus] **I-30869**
Inorganic substance content in atmospheric precipitation at Mirnyy Station [1984, rus] **I-30872**
Potential CO2-induced changes in West Antarctica [1984, eng] **I-31102**
Modeling the oceanic environment of West Antarctica [1984, eng] **I-31112**
Atmospheric trace gas measurements at Palmer Station, Antarctica: 1982-83 [1984, eng] **I-31267**
Aerosols in the antarctic stratosphere after El Chichon eruption [1985, eng] **I-31403**
Major climatic events associated with a prolonged CO2-induced warming [1981, eng] **I-31441**
Latitudinal distribution of CO, California to Antarctica [1984, eng] **I-31447**
Glaciological trace element investigations at German antarctic stations [1985, ger] **I-31612**
Ammonia and ammonium concentrations in the antarctic atmosphere [1983, eng] **I-31632**
Seasonal components of atmospheric CO2: information from new approaches to the decomposition of seasonal time series [1985, eng] **I-31649**
Delta C-13 variations in marine carbonate sediments as indicators of the CO2 balance between the atmosphere and oceans [1977, eng] **J-31431**
Hydroxyl rotational temperature measurements [1983, eng] **K-28998**

CIRCULATION
Eliassen-Palm cross sections for the Northern and Southern Hemispheres [1982, eng] **E-30071**
Antarctic sea ice conditions and cyclonic activity in winters 1973-1977 [1983, eng] **F-30931**
Empirical model of a south polar circulation cell [1982, rus] **I-28966**
Structure of atmospheric boundary layer over East Antarctica [1982, rus] **I-28967**
Monthly mean wind stress over the global ocean [1983, eng] **I-29005**
Atmospheric circulation over the Indian Ocean [1983, rus] **I-29083**
Southern Hemisphere general circulation model in January [1983, eng] **I-29108**
External gravity field effects on climate [1983, rus] **I-29296**
Measurements of aerosol particles over the southwestern Indian Ocean [1983, eng] **I-29444**
Cycle of Southern Hemisphere atmospheric energy [1983, eng] **I-29507**
Synoptic observations at Molodezhnaya Station [1983, rus] **I-29649**
Steering of global climate by the polar regions [1983, ger] **I-29698**
Atmospheric circulation patterns in the Southern Hemisphere [1983, rus] **I-29733**
Circulation contrasts in the southern hemisphere winters of 1972 and 1973 [1983, eng] **I-29830**
Interannual variability of Southern Hemisphere circulation [1984, eng] **I-30022**
Stratospheric 4-day wave manifests warm pool [1984, eng] **I-30024**
Variations of Southern Hemisphere sea level pressure gradients and wind [1984, eng] **I-30025**
Observations of wave-mean flow interaction in the Southern Hemisphere [1984, eng] **I-30037**
Earth's atmosphere as seen from Antarctica [1982, eng] **I-30038**
Variation of Southern Hemisphere atmospheric vorticity around interplanetary magnetic field sector crossings [1983, eng] **I-30153**
Weather and climate of the Antarctic [1984, eng] **I-30185**
Summer circulation in middle atmosphere [1984, eng] **I-30265**
Katabatic wind forcing of the Terra Nova Bay polynya [1984, eng] **I-30382**
Theory of cyclogenesis and blocking in the Southern Hemisphere [1984, eng] **I-30385**
Interaction of atmosphere, ice, and ocean in Antarctica [1982, fre] **I-30436**
Zonal average thermosphere [1984, eng] **I-30501**
Global distribution of thermospheric odd nitrogen [1984, eng] **I-30502**
Drag coefficient across the Antarctic marginal ice zone [1984, eng] **I-30549**
Antarctic automatic weather stations, austral summer 1982-1983 [1983, eng] **I-30702**
Temperature anomalies and their association with atmospheric circulation [1983, eng] **I-30812**
Cyclone variability and relationship to sea ice extent [1983, eng] **I-30813**
Structure of the atmospheric boundary layer over the southern ocean [1984, rus] **I-30846**
Second All-Union Symposium "Meteorological studies in the Antarctic" [1984, rus] **I-30856**
Model of stratospheric ozone distribution [1984, eng] **I-30859**
Model of stratospheric ozone distribution [1984, eng] **I-30859**
Report on scientific activity in meteorology and atmospheric physics 1979-1982 [1983, rus] **I-31015**
Atmospheric circulation affecting the west antarctic region in summer [1984, eng] **I-31105**
Precipitation regime of the west antarctic ice sheet [1984, eng] **I-31108**

Atmosphere
CIRCULATION *(cont.)*
AGCM simulations of the modern antarctic climate [1984, eng] **I-31111**
Analogies in atmospheric processes for long range forecasting [1984, rus] **I-31318**
Influence of the southern oscillation on atmospheric carbon dioxide [1977, eng] **I-31430**
Distribution of atmospheric energy [1982, eng] **I-31645**
Thermally-forced mean mass circulations in the Southern Hemisphere [1985, eng] **I-31709**
Sensitivity of general circulation models [1983, eng] **I-31742**
Temperature anomalies in the southern ocean [1984, rus] **J-30844**
Peculiarities of circulation of the antarctic atmosphere and waters of the southern ocean [1984, eng] **K-30638**
DENSITY
Terrestrial refraction over the ice sheet of Enderby Land [1981, ger] **I-30907**
DISTURBANCES
Energy transformation in atmosphere [1982, rus] **I-28965**
Weather and climate of the Antarctic [1984, eng] **I-30185**
Atmospheric boundary layer changes at Filchner Station [1985, ger] **I-31617**
Sferics-induced emissions in the VLF range [1985, ger] **I-31622**
Atmospheric circulation and formation of Weddell polynya [1985, rus] **I-31650**

Adaptive peculiarities of the breeding cycle of some antarctic birds [1984, rus] **B-31567**
Annual food requirements of seabirds at Bird Island [1984, eng] **B-31590**

ECOLOGY
Microbiology of Paradise Harbor [1983, spa] **B-29135**
Working party on bird ecology [1982, eng] **B-29184**
Data analysis of seabird ecology workshop [1981, eng] **B-29255**
DDT in the vicinity of Molodezhnaya Station [1983, rus] **B-29738**
Adaptive peculiarities of the breeding cycle of some antarctic birds [1984, rus] **B-31567**

EXPLOITATION
Indirect indicators of changes in krill availability applied to pinnipeds and seabirds [1983, eng] **B-29960**

GEOGRAPHIC DISTRIBUTION
Visual observations of the antarctic sea birds during the FIBEX cruise of the *Kaiyo Maru* [1982, eng] **B-29386**
Distribution of sea birds and water masses in summer [1983, rus] **B-29686**
Reactions of sea birds to a ship in the southern ocean [1982, eng] **B-29914**
Marine bird distribution in antarctic waters [1983, eng] **B-30531**
Distribution of seabirds in the African sector of FIBEX [1983, eng] **B-30836**
Zoological studies in the area of Bellingshausen Station [1984, rus] **B-30850**
Procellariforms and penguins of Antarctica [1984, eng] **B-30986**

MARKING
Working Party on Bird Ecology [1983, eng] **B-29258**
Bird ringing at Marion and Prince Edward Islands, 1977-1982 [1982, eng] **B-30172**
Bird ringing at Gough Island, 1977-1982 [1983, eng] **B-30841**

MIGRATION
Bird ringing at Marion and Prince Edward Islands, 1977-1982 [1982, eng] **B-30172**

MORPHOLOGY
Garganey on St. Paul and Amsterdam Islands [1983, eng] **B-30591**

NUTRITION
Ecological studies of pygoscelid penguins and antarctic skuas [1981, eng] **B-29874**
Annotated atlas of the vascular flora of Macquarie Island [1984, eng] **B-30154**
Food chain of antarctic marine living resources [1984, eng] **B-30443**
Weka on Macquarie Island [1984, eng] **B-30506**
Parasite infestations and food of animals near Bellingshausen Station [1984, ger] **B-30749**
Birds of Antarctica—objects of our studies [1984, ger] **B-30828**
Distribution of seabirds in the African sector of FIBEX [1983, eng] **B-30836**
Procellariforms and penguins of Antarctica [1984, eng] **B-30986**
Marine food of the birds of Marion Island [1981, eng] **B-31459**
Metabolizable energies of dry boiled krill *(Euphausia superba)* for chickens [1983, jpn] **B-31576**
Annual food requirements of seabirds at Bird Island [1984, eng] **B-31590**

PATHOLOGY
DDT in tissues and eggs of migrating seabirds from South Shetland Islands [1983, eng] **B-30346**
Parasitological collections from seabirds at Palmer Station [1983, eng] **B-30681**

PHYSIOLOGY
DDT in tissues and eggs of migrating seabirds from South Shetland Islands [1983, eng] **B-30346**

POPULATION
Reactions of sea birds to a ship in the southern ocean [1982, eng] **B-29914**
Ornithological observations at Gough Island, 1979-1981 [1982, eng] **B-30171**
Weka on Macquarie Island [1984, eng] **B-30506**
Marine bird distribution in antarctic waters [1983, eng] **B-30531**
Garganey on St. Paul and Amsterdam Islands [1983, eng] **B-30591**

Distribution of seabirds in the African sector of FIBEX [1983, eng] **B-30836**
Zoological studies in the area of Bellingshausen Station [1984, rus] **B-30850**
Annual food requirements of seabirds at Bird Island [1984, eng] **B-31590**

TAXONOMY
Visual observations of the antarctic sea birds during the FIBEX cruise of the *Kaiyo Maru* [1982, eng] **B-29386**
Ornithological observations at Gough Island, 1979-1981 [1982, eng] **B-30171**
Bird ringing at Marion and Prince Edward Islands, 1977-1982 [1982, eng] **B-30172**
New Zealand National Museum catalogue of bird anatomical specimens [1982, eng] **B-30589**

Aves-Anseriformes
BEHAVIOR
Sexually distinct daily activity patterns of Blue-eyed Shags in Antarctica [1984, eng] **B-30092**
Energetics and parental investment of the Blue-eyed Shag [1982, eng] **B-30309**

BREEDING CYCLES AND REPRODUCTION
Sexually distinct daily activity patterns of Blue-eyed Shags in Antarctica [1984, eng] **B-30092**
Energetics and parental investment of the Blue-eyed Shag [1982, eng] **B-30309**

NUTRITION
Feeding of the upland goose and ruddy-headed goose on Falkland Islands [1982, eng] **B-31185**

PATHOLOGY
Mortality of geese on Falkland Islands [1982, eng] **B-29059**

Aves-Charadriiformes
Breeding and feeding of brown skuas on Bird Island [1985, eng] **B-31584**

BEHAVIOR
Territoriality in lesser sheathbills on Marion Island [1984, eng] **B-30556**
Skuas at the Schirmacher Ponds [1983, ger] **B-30766**
Predation by skuas on burrowing petrels at Marion Island [1983, eng] **B-30839**
Breeding season time budgets of the Southern Black-backed gull in Antarctica [1984, eng] **B-31056**

BREEDING CYCLES AND REPRODUCTION
Skuas at the Schirmacher Ponds [1983, ger] **B-30766**
Breeding season time budgets of the Southern Black-backed gull in Antarctica [1984, eng] **B-31056**
Breeding biology of McCormick's skua *Catharacta maccormicki* at Signy Island [1984, eng] **B-31119**
Breeding distribution of the Brown Skua on Macquarie Island [1984, eng] **B-31321**

GEOGRAPHIC DISTRIBUTION
Skua and petrel sightings in the Thiel and southern Pensacola Mountains [1983, eng] **B-30689**
Skuas at the Schirmacher Ponds [1983, ger] **B-30766**

NUTRITION
Breeding biology of McCormick's skua *Catharacta maccormicki* at Signy Island [1984, eng] **B-31119**
Breeding distribution of the Brown Skua on Macquarie Island [1984, eng] **B-31321**

PATHOLOGY
Blackbacked gull identified as new trematode host [1982, ger] **B-29723**
Anomotaenia dominicana of the gull *Larus dominicanus* from King George Island [1984, eng] **B-30819**

POPULATION
Breeding biology of McCormick's skua *Catharacta maccormicki* at Signy Island [1984, eng] **B-31119**
Census of the South Polar Skua at Cape Hallett, Antarctica [1984, eng] **B-31602**

Aves-Procellariiformes
Bedfordiella and lice from Kerguelen Petrel [1983, eng] **B-30712**
Procellariforms and penguins of Antarctica [1984, eng] **B-30986**
Breeding, distribution and status of burrow-nesting petrels at Macquarie Island [1984, eng] **B-31500**

BEHAVIOR
Fertilisation of Wandering Albatross eggs on Macquarie Island [1983, eng] **B-29096**
Petrels of Antipodes, Prince Edward and Gough Islands [1983, eng] **B-29689**
Activity budgets of foraging Gray-headed Albatrosses [1984, eng] **B-30662**
Predation by skuas on burrowing petrels at Marion Island [1983, eng] **B-30839**

Aves-Procellariiformes

BEHAVIOR *(cont.)*

Breeding sites of snow petrels in Queen Maud Land [1983, eng] **B-30843**

BLOOD AND CIRCULATION

Collection of blood samples and gonad inspection in albatrosses [1984, eng] **B-30119**

Incubation physiology of the giant petrel *Macronectes giganteus* [1983, eng] **B-30293**

BREEDING CYCLES AND REPRODUCTION

Fertilisation of Wandering Albatross eggs on Macquarie Island [1983, eng] **B-29096**

Large snow petrels on the South Sandwich Islands [1983, eng] **B-29097**

Interspecific breeding in giant petrels at South Georgia [1982, eng] **B-29206**

Petrels of Antipodes, Prince Edward and Gough Islands [1983, eng] **B-29689**

Moult of giant petrels at South Georgia [1984, eng] **B-29811**

Collection of blood samples and gonad inspection in albatrosses [1984, eng] **B-30119**

Incubation physiology of the giant petrel *Macronectes giganteus* [1983, eng] **B-30293**

Breeding sites of snow petrels in Queen Maud Land [1983, eng] **B-30843**

Breeding biology of Wilson's storm petrel on Bird Island [1985, eng] **B-31580**

ECOLOGY

Petrels of Antipodes, Prince Edward and Gough Islands [1983, eng] **B-29689**

Egg temperature and embryo metabolism in procellariiformes [1984, eng] **B-30163**

Radiocarbon dating of breeding places of petrels in the Antarctic [1984, eng] **B-30456**

EMBRYOLOGY

Egg temperature and embryo metabolism in procellariiformes [1984, eng] **B-30163**

GEOGRAPHIC DISTRIBUTION

Fertilisation of Wandering Albatross eggs on Macquarie Island [1983, eng] **B-29096**

Large snow petrels on the South Sandwich Islands [1983, eng] **B-29097**

Petrels of Antipodes, Prince Edward and Gough Islands [1983, eng] **B-29689**

Comparative study of metabolic rates in procellariiformes [1984, eng] **B-30164**

Skua and petrel sightings in the Thiel and southern Pensacola Mountains [1983, eng] **B-30689**

Breeding sites of snow petrels in Queen Maud Land [1983, eng] **B-30843**

Movements of giant petrels ringed at South Georgia [1984, eng] **B-31471**

Breeding biology of Wilson's storm petrel on Bird Island [1985, eng] **B-31580**

Distribution of the spectacled, white-chinned petrel in the South Atlantic [1985, eng] **B-31586**

MIGRATION

Movements of giant petrels ringed at South Georgia [1984, eng] **B-31471**

MORPHOLOGY

Morphology of Wandering Albatrosses on Macquarie Island [1984, eng] **B-30507**

Breeding biology of Wilson's storm petrel on Bird Island [1985, eng] **B-31580**

NUTRITION

Food conversion metabolism in albatross chicks [1984, eng] **B-30659**

Activity budgets of foraging Gray-headed Albatrosses [1984, eng] **B-30662**

Food of Antarctic Petrels *(Thalassoica antarctica)* [1984, eng] **B-31320**

PATHOLOGY

Plastic particle pollution in great shearwaters from Gough Island [1983, eng] **B-30842**

PHYSIOLOGY

Homeothermy in petrels and prions [1983, eng] **B-29720**

Metabolic rate in the Wandering Albatross [1984, eng] **B-30093**

Egg temperature and embryo metabolism in procellariiformes [1984, eng] **B-30163**

Comparative study of metabolic rates in procellariiformes [1984, eng] **B-3016**

Incubation physiology of the giant petrel *Macronectes giganteu* [1983, eng] **B-3029**

Olfactory experiments on some antarctic birds [1984, eng] **B-3050**

Food conversion metabolism in albatross chicks [1984, eng] **B-3065**

POPULATION

Predation by skuas on burrowing petrels at Marion Island [1983, eng] **B-3083**

Aves-Sphenisciformes

Summer in the Antarctic among penguins, seals and whaling relic [1983, nor] **A-3054**

Biology of well-dressed birds [1983, eng] **B-3001**

Zoological observations, Royal Bay, South Georgia 1882-1883. Pa 2: penguins [1984, eng] **B-3018**

Antarctica comes to California: the Penguin Encounter at Sea Wor [1984, eng] **B-3056**

Procellariforms and penguins of Antarctica [1984, eng] **B-3098**

Chemistry of guano soils at Cape Bird [1984, eng] **E-2971**

Ammonia and enzyme in guano soils of Cape Bird [1984, eng] **E-2971**

Note on rock striations caused by penguin feet, Falkland Islan [1985, eng] **E-315**

BEHAVIOR

Diving depths of the Gentoo penguin [1983, eng] **B-291**

Note on the feeding behavior of the Adélie penguin [1983, jpn] **B-294**

Acid-base balance in penguin chicks exposed to thermal stress [198 eng] **B-297**

Chick-feeding rates of Macaroni and Rockhopper penguins at Mari Island [1982, eng] **B-299**

Nest site competition between penguin species [1984, eng] **B-310**

Utilization of a squid diet by adult King penguins [1984, eng] **B-310**

Behavior of penguins adapted to ice and tropics [1984, eng] **B-312**

Field study of the development of behavior in Adélie penguins [197 eng] **B-314**

BREEDING CYCLES AND REPRODUCTION

Working party on bird ecology [1982, eng] **B-291**

Resting metabolism and energetic cost of incubation in macaroni a rockhopper penguins [1984, eng] **B-305**

Breeding and feeding ecologies of pygoscelid penguins [1983, eng] **B-306**

Distribution, numbers and breeding of penguins at Admiralty B 1979-1980 [1984, eng] **B-307**

Distribution, numbers and breeding of penguins on King George Isla 1980-1981 [1984, eng] **B-307**

Nest site competition between penguin species [1984, eng] **B-310**

Behavior of penguins adapted to ice and tropics [1984, eng] **B-312**

Comparative breeding biology of Adélie and Chinstrap penguins Signy Island [1985, eng] **B-312**

Apparent double blastoderms in Adélie penguin eggs [1985, eng] **B-31**

ECOLOGY

Nitrogen pathway in a penguin rookery [1984, eng] **B-30**

Water composition changes from penguin rookeries in Admiralty [1983, eng] **B-30**

Effect of light on circadian rhythmicity in the body temperatur Adélies [1983, eng] **B-30**

Distribution, numbers and breeding of penguins at Admiralty 1979-1980 [1984, eng] **B-30**

Distribution, numbers and breeding of penguins on King George Isl 1980-1981 [1984, eng] **B-30**

Prospects for satellite remote sensing of Adelie penguin rooke [1984, eng] **B-30**

Ecological study of three species of penguins [1985, spa] **B-31**

Ornithogenic soils on King George Island [1984, eng] **E-30**

Phosphates of ornithogenic soils on the volcanic King George Is (Maritime Antarctic) [1984, eng] **E-30**

EVOLUTION

Field study of the development of behavior in Adélie penguins [19 eng] **B-31**

SUBJECT INDEX

GEOGRAPHIC DISTRIBUTION
Working party on bird ecology [1982, eng] **B-29184**
Distribution and abundance of antarctic and subantactic penguins [1983, eng] **B-29246**
Penguins of the Ross Sea region [1984, eng] **B-30580**
LOCOMOTION
Diving depths of the Gentoo penguin [1983, eng] **B-29150**
Energetics of walking in penguins [1984, eng] **B-31588**
Free-ranging energetics of penguins [1984, eng] **B-31589**
MORPHOLOGY
Appendicular musculature of penguins [1982, eng] **B-29222**
Fine structure and gas exchange in Adélie penguin lungs [1983, eng] **B-29915**
NUTRITION
Glucose and lactate kinetics in emperor penguin [1982, eng] **B-29046**
Diving depths of the chinstrap penguin *Pygoscelis antarctica* [1983, eng] **B-29063**
Diving depths of the Gentoo penguin [1983, eng] **B-29150**
Note on the feeding behavior of the Adélie penguin [1983, jpn] **B-29408**
Chick-feeding rates of Macaroni and Rockhopper penguins at Marion Island [1982, eng] **B-29913**
Mineralization of penguin excrements in Admiralty Bay [1983, eng] **B-30343**
Breeding and feeding ecologies of pygoscelid penguins [1983, eng] **B-30683**
Utilization of a squid diet by adult King penguins [1984, eng] **B-31096**
PATHOLOGY
Rockhopper penguin on Cormorant Island [1982, eng] **B-30194**
Scolex functional morphology of Cestoda from penguins [1982, eng] **B-30333**
DDT residues in tissue and eggs of three species of penguins at King George Island [1983, eng] **B-30345**
PHYSIOLOGY
Glucose and lactate kinetics in emperor penguin [1982, eng] **B-29046**
Diving depths of the chinstrap penguin *Pygoscelis antarctica* [1983, eng] **B-29063**
Acid-base balance in penguin chicks exposed to thermal stress [1983, eng] **B-29796**
Fine structure and gas exchange in Adélie penguin lungs [1983, eng] **B-29915**
Nitrogen pathway in a penguin rookery [1984, eng] **B-30121**
Mineralization of penguin excrements in Admiralty Bay [1983, eng] **B-30343**
DDT residues in tissue and eggs of three species of penguins at King George Island [1983, eng] **B-30345**
Resting metabolism and energetic cost of incubation in macaroni and rockhopper penguins [1984, eng] **B-30585**
Effect of light on circadian rhythmicity in the body temperature of Adélies [1983, eng] **B-30684**
Behavior of penguins adapted to ice and tropics [1984, eng] **B-31243**
Liver metabolism in fish and other vertebrates [1984, eng] **B-31406**
Energetics of walking in penguins [1984, eng] **B-31588**
Free-ranging energetics of penguins [1984, eng] **B-31589**
Remarkable adaptation of penguins to the cold [1981, fre] **B-31755**
POPULATION
Working party on bird ecology [1982, eng] **B-29184**
Distribution and abundance of antarctic and subantactic penguins [1983, eng] **B-29246**
Estimate of the number of penguins on the South Shetland Islands [1983, spa] **B-29304**
Penguin census on Ardley Island [1983, spa] **B-29305**
Penguins of the Ross Sea region [1984, eng] **B-30580**
Distribution, numbers and breeding of penguins at Admiralty Bay, 1979-1980 [1984, eng] **B-30778**
Distribution, numbers and breeding of penguins on King George Island, 1980-1981 [1984, eng] **B-30779**
Prospects for satellite remote sensing of Adelie penguin rookeries [1984, eng] **B-30822**
Adélie penguin census in 1981-1983 breeding seasons near Showa Station [1984, eng] **B-30901**

SUBJECT INDEX

Antifree accumulation patterns in insects [1983, eng] B-29674
Metabolism in marbled notothenia [1981, eng] B-29687
Carbohydrates related to phytoplankton in Bransfield Strait [1984, eng] B-29715
DDT in the vicinity of Molodezhnaya Station [1983, rus] B-29738
Acid-base balance in penguin chicks exposed to thermal stress [1983, eng] B-29796
Digestibility of actomyosin in krill [1983, jpn] B-29812
Proteins in the muscles of an antarctic fish [1980, eng] B-29823
Protein concentration and measurements in sea-water suspensions [1980, eng] B-29877
Deterioration of krill muscle during freeze storage [1983, eng] B-29878
Stereochemistry of 7beta-Acetoxy-22-hydroxyhopane from a South Georgia lichen [1983, eng] B-29918
Supercooling and winter survival in terrestrial arthropods [1982, eng] B-29955
Antifreeze agents of terrestrial arthropods [1982, eng] B-29956
Environmental triggers to cold hardening [1982, eng] B-29957
Biological antifreeze agents in coldwater fishes [1982, eng] B-29959
Lake sediment chlorophyll *a* and adenosine triphosphate levels [1983, eng] B-29978
Lipid content and composition of some antarctic macrozooplankton [1984, eng] B-30115
Nitrogen pathway in a penguin rookery [1984, eng] B-30121
Distribution of Vitamin B12 and phytoplankton in the antarctic ocean [1984, fre] B-30122
Chlorophyll *a* distribution in the Indian Ocean [1984, eng] B-30126
Concentration of heavy metals in antarctic fish *Pagothenia borchgrevinki* [1983, eng] B-30178
Extraction of protein from antarctic krill, Part 3 [1982, eng] B-30270
Changes in cooked odor of antarctic krill during frozen storage [1984, eng] B-30278
Characterization of the mineral compositon of isolated krill proteins [1983, eng] B-30297
Myofibrillar proteins in freezing and thawing of krill [1984, eng] B-30299
Nitrogen distribution in marine environment by phytoplankton and bacteria [1982, eng] B-30308
Ecology of *Cyclothone microdon* in the southern part of the Pacific Ocean [1981, eng] B-30320
Reproduction of "limbless" sole (Bothidae) in southwestern Atlantic [1981, eng] B-30321
Nutritive value of antarctic krill [1981, eng] B-30335
Mineralization of penguin excrements in Admiralty Bay [1983, eng] B-30343
Water composition changes from penguin rookeries in Admiralty Bay [1983, eng] B-30344
DDT residues in tissue and eggs of three species of penguins at King George Island [1983, eng] B-30345
DDT in tissues and eggs of migrating seabirds from South Shetland Islands [1983, eng] B-30346
Dark fixation of CO2 in the subtropical North Pacific Ocean and the Weddell Sea [1983, eng] B-30355
Extraordinary peat-forming community on the Falkland Islands [1984, eng] B-30420
Effect of storage and handling on fatty acid composition of krill [1984, rus] B-30433
Astaxanthin content of silver salmon *(Oncorhynchus kisulch)* [1983, jpn] B-30551
Antarctic lake heterotrophic community response to high oxygen [1984, eng] B-30553
Vertical distribution of organic constituents in Lake Vanda [1984, eng] B-30555
Resting metabolism and energetic cost of incubation in macaroni and rockhopper penguins [1984, eng] B-30585
Radionuclides in plankton from the South Pacific basin [1984, eng] B-30600
Nutrient flow in antarctic tundra communities [1984, spa] B-30607
Utilization of *Euphausia superba* [1982, jpn] B-30610
Utilization of *Euphausia superba* [1982, jpn] B-30611
Study of muscular proteins in krill for human consumption [1983, jpn] B-30612
Effects of protease inhibitors on antarctic krill [1984, eng] B-30626
Protein electrophoresis in antarctic whales, Part 3 [1981, rus] B-30654
Bioassay demonstration that the effect of trace elements on the growth of antarctic phytoplankton is negligible [1984, fre] B-30663
Field and laboratory studies of antarctic krill, austral summer 1982-83 [1983, eng] B-30678
Lipid biochemistry of antarctic midwater organisms [1983, eng] B-30679
Role of glycoprotein antifreezes in freezing avoidance of antarctic fish [1983, eng] B-30680
Properties of antifreeze proteins from fish blood and penguin egg-white proteins [1983, eng] B-30682
Strategies for growth and survival of antarctic oasis lake biota [1983, eng] B-30690
Halotolerance of micro-organisms isolated from saline dry valley soils [1983, eng] B-30691
Comparative analysis of leucine transport in fish liver [1984, eng] B-30718

Meeting of BIOMASS Working Party on Bird Ecology [1984, eng] **B-31086**
International interest in marine mammals [1985, spa] **B-31415**
Working Party on Fish Ecology. Report of the fourth meeting. Dammarieles-Lys, France, Aug. 25-29, 1984 [1985, eng] **B-31734**
1980 annual meetings [1980, eng] **E-30197**
1982 annual meetings [1982, eng] **E-30198**
Physical and chemical studies on ice from glaciers and ice sheets [1974, jpn] **F-30358**
Second All-Union Symposium "Meteorological studies in the Antarctic" [1984, rus] **I-30856**
Paleoclimatic research and models [1983, eng] **I-31739**
Oil pollution in the Antarctic [1983, eng] **J-31557**
Emerging Convention on the conservation of antarctic marine living resources: an attempt to meet the new realities of resource exploitation in the southern ocean [1982, eng] **M-30053**
United Nations and Antarctica [1984, eng] **M-30186**
Antarctic mineral resources [1983, eng] **M-30213**
Antarctic challenge: conflicting interests, cooperation, environmental protection, economic development [1984, eng] **M-30439**
Antarctica: a case for the UN? [1984, eng] **M-30823**
Chile's contribution to the Antarctic Treaty [1984, spa] **M-31350**
Environmental impact of possible antarctic mineral resource development [1984, spa] **M-31358**
Acceptability criteria of an antarctic minerals regime [1984, spa] **M-31361**
International community and Antarctica [1984, spa] **M-31362**
Antarctica, cold region of fiery, red-hot politics [1982, spa] **M-31476**

Acoustic Working Party
Report of Acoustic Working Party meeting to prepare for Post-FIBEX Acoustic Workshop, 1984 [1984, eng] **B-31261**

Antarctic Treaty Consultative Meeting
Report of the Twelfth Antarctic Treaty Consultative Meeting, Canberra, 1983 [1984, eng] **A-29490**

BIOMASS
BIOMASS executive. Report of the second 1984 meeting, Bremerhaven, F.R.G., 2-3 October 1984 [1984, eng] **B-31016**
BIOMASS Executive report of 1984 meeting, Cambridge, UK, 20-22 June, 1984 [1984, eng] **B-31260**

Commission for the Conservation of Antarctic Marine Living Resources
Annual meeting of the CCAMLR, 1983 [1983, ger] **A-30326**

Contributions of the GDR to Antarctic Geological Research
Report on the workshop "Contributions of the German Democratic Republic to antarctic geological research (1973-1983)" [1984, ger] **E-30086**

European Marine Biology Symposium
Marine biology and stress effects in polar regions [1983, eng] **B-31744**

Group of Specialists on Living Resources of the Southern Oceans
Meeting of southern ocean ecosystems specialists, June, 1982, Japan [1982, eng] **B-29181**
Data, statistics and resource evaluation, Tokyo, Japan, May 1982 [1982, eng] **B-29182**

Group of Specialists on Southern Ocean Ecosystems and their Living Resources
Meeting of the SCAR Group of Specialists on Seals [1983, eng] **B-29160**

International Quaternary Association
Eleventh INQUA symposium on paleoclimatology and glacial history of the Southern Hemisphere [1983, rus] **I-29934**

International Symposium on Earth Sciences
Antarctic earth science [1983, eng] **E-29517**

International Symposium on Krill
Proceedings: Biology of the antarctic krill *Euphausia superba* [1984, eng] **B-31191**

International Union for Conservation of Nature and Natural Resources
16th session of the General Assembly of IUCN, Madrid, Spain, 5-14 November 1984, Resolutions [1984, eng] **A-31675**

Post-FIBEX Data Interpretation Workshop
First Post-FIBEX Hydrographic Data Interpretation Workshop [1982, eng] **J-29191**
Second Post-FIBEX Hydrographic Data Interpretation Workshop [1983, eng] **J-29192**

SCAR Group of Specialists on Living Resources of the Southern Oceans
Report on the BIOMASS Data Workshop [1980, eng] **B-29254**

SCAR Group of Specialists on Southern Ocean Ecosystems and their Living Resources
Data analysis of seabird ecology workshop [1981, eng] **B-29255**
SIBEX Chief Scientists' Meeting [1983, eng] **B-29256**
Meeting on squid biology [1983, eng] **B-29257**
Working Party on Bird Ecology [1983, eng] **B-29258**

SCAR Seminar on the Biology of Krill
Seminar on krill biology, Bremerhaven, May 1983 [1983, eng] **B-29339**

SCAR Technical Group on Programme Implementation and Coordination
BIOMASS program implementation and coordination meeting [1982, eng] **B-29190**
FIBEX implementation and coordination [1980, eng] **B-29253**

SCAR Working Party on Fish Biology
Working party on fish biology [1980, eng] **B-29252**

SCAR Working Party on Krill Abundance
Report of the third meeting [1980, eng] **B-29251**

Scientific Committee on Antarctic Research
  17th SCAR meeting in Leningrad [1984, spa] **A-31246**
  Antarctic marine biology symposium in Bariloche [1984, spa] **A-31251**
  Nutrient cycles and food chains in the Antarctic [1984, eng] **B-30096**
  SCAR and the development of scientific cooperation [1984, spa] **M-31354**
Special Consultative Meeting on Mineral Resources in the Antarctic
  Report on consultative meeting on antarctic mineral resources [1983, eng] **A-29309**
Symposium on Antarctic Biology
  Proceedings of the Fifth Symposium on Antarctic Biology [1982, eng] **B-29374**
Symposium on Antarctic Geosciences
  Proceedings of the Third Symposium on Antarctic Geosciences, 1982 [1983, eng] **E-29111**
  Proceedings of the Fourth Symposium on Antarctic Geosciences, 1983 [1984, eng] **E-30908**
Symposium on Antarctic Meteorites
  Proceedings of the Eighth Symposium on Antarctic Meteorites [1983, eng] **E-29984**
Symposium on Antarctic Research by the GDR
  Symposium on antarctic research by the GDR [1983, ger] **A-30754**
Symposium on Ice and Climate Modelling
  Symposium on Ice and Climate Modeling, 1983 [1984, eng] **F-30478**
Symposium on Polar Biology
  Proceedings of the Sixth Symposium on Polar Biology [1984, eng] **B-30888**
Symposium on Polar Meteorology and Glaciology
  Proceedings of the Fifth Symposium on Polar Meteorology and Glaciology [1983, eng] **I-29260**
The Antarctic: Preferred Futures, Constraints and Choices
  Antarctic: preferred futures, constraints and choices [1983, eng] **A-31024**
Working Party on Bird Ecology
  Working party on bird ecology [1982, eng] **B-29184**
Working Party on Fish Biology
  Aging of antarctic fishes [1982, eng] **B-29183**
Working Party on Fish Ecology
  Working Party on Fish Ecology [1982, eng] **B-29185**
Workshop on the Biology and Oceanography of Antarctic Krill Distribution
  Workshop on the biology and oceanography of antarctic krill distribution [1984, eng] **B-31215**
Conjugate points
  On the observation of conjugate points [1983, jpn] **K-29219**
  Direct multiple path magnetospheric propagation [1984, eng] **K-29967**
  Report of the 1983 conjugate campaign in Iceland [1984, eng] **K-30130**
  Proceedings of the sixth symposium on coordinated observations of the ionosphere and the magnetosphere in the polar regions [1984, eng] **K-30494**
  Conjugate observation of periodic VLF emissions near L=6 [1984, eng] **K-30496**
  Auroral X-ray pulsations associated with VLF pulsations [1984, eng] **K-30497**
  Operation plan for the Iceland-Syowa conjugate campaign in 1983-1985 [1984, eng] **K-30498**
  Spread-*F* ionospheric irregularities and their relationship to stable auroral red arcs at magnetic mid-latitudes [1984, eng] **K-30722**
  Nearly simultaneous observations of the conjugate polar cusp regions [1984, eng] **K-30935**
  Conjugate magnetic pulsation studies at Siple, Roberval, and DE-1 [1983, eng] **K-30956**
  Variable frequency VLF signals in the magnetosphere: associated phenomena and plasma diagnostics [1985, eng] **K-31264**
  Onset time interval of geomagnetic disturbances in the conjugate areas [1984, eng] **K-31385**
  See also: Geomagnetic field/Conjugacy
Conservation
  Use and abuse of polar environmental resources [1984, eng] **A-29486**
  Scientific research and cooperation in Antarctica [1984, eng] **A-30441**
  Antarctica [1983, eng] **A-30545**
  Protection of antarctic environment and private expeditions [1984, spa] **A-30608**
  Antarctic: preferred futures, constraints and choices [1983, eng] **A-31024**
  Antarctic adventure [1984, ger] **A-31242**
  Bulletin, Vol.16, No.1/3 [1985, eng] **A-31674**
  16th session of the General Assembly of IUCN, Madrid, Spain, 5-14 November 1984, Resolutions [1984, eng] **A-31675**
  Evaluation of man's impact on antarctic environment [1985, eng] **A-31683**
  Annual report of the Marine Mammal Commission, 1983 [1984, eng] **B-29318**
  Chlordane compounds residue in Weddell seals [1984, eng] **B-29671**
  Economic aspects of marine mammal exploitation [1981, eng] **B-29676**
  Management of marine mammals [1981, eng] **B-29677**
  Review of pygmy blue whale stock in the Antarctic [1981, eng] **B-29678**
  Note on the abundance of antarctic blue whales [1981, eng] **B-29679**
  Antarctic (Kerguelen) fur seal [1979, eng] **B-29691**
  Subantarctic fur seal [1979, eng] **B-29692**
  Ross seal [1979, eng] **B-29693**
  Weddell seal [1979, eng] **B-29694**
  Convention on the Conservation of Antarctic Marine Living Resources in action [1983, rus] **B-29709**
  Status of the antarctic fur seal, *Arctocephalus gazella* [1982, eng] **B-29711**
  Distribution and abundance of seals in the australasian region, with summaries of biology and current research [1982, eng] **B-29712**
  History of the regulation of southern minke whaling scientific advice and a response of industry [1981, eng] **B-29751**

Studies on the complex of electromagnetic phenomena in the Antarctic [1984, eng] K-30632
Nearly simultaneous observations of the conjugate polar cusp regions [1984, eng] K-30935
Mid-latitude Pi 2 pulsations, geosynchronous substorm onset signatures and auroral zone currents on March 22, 1979: CDAW 6 [1985, eng] K-31263

Polar cusp dynamics [1985, eng] K-31265
Onset time interval of geomagnetic disturbances in the conjugate areas [1984, eng] K-31385
Aurora and polar upper atmosphere [1983, jpn] K-31634
ACTIVITY INDICES
Coupling between magnetic activity and ionospheric absorption [1983, spa] K-29151
Influence of the interplanetary environment on auroral zones [1983, spa] K-29152
Magnetic pulsation activity at South Pole Station [1983, eng] K-30949
BAYS AND PULSATIONS
Short-period magnetic pulsations and VLF emissions [1984, eng] K-29966
Harmonic structure of Pc 3-5 magnetic pulsations [1984, eng] K-30350
Auroral X-ray pulsations associated with VLF pulsations [1984, eng] K-30497
Morning Pi 1 and field aligned currents [1984, eng] K-30500
Behavior of plasma sheet during breakup according to Mirnyy Station data [1984, eng] K-30634
Magnetic pulsation activity at South Pole Station [1983, eng] K-30949
Conjugate magnetic pulsation studies at Siple, Roberval, and DE-1 [1983, eng] K-30956
Recent advances from studies of the Trimpi effect [1983, eng] K-30957
Whistler-induced perturbations of broadcast band signals [1983, eng] K-30959
Pc1-2 discrete regular daytime pulsation bursts at high latitudes [1985, eng] K-31386
STORMS
Magnetic effects of vortical currents [1983, spa] K-29479
Oscillating magnetic field shell [1984, eng] K-29965
Ground-observed VLF peculiarities connected to plasma processes in the magnetosphere [1984, eng] K-30414
Proceedings of the sixth symposium on coordinated observations of the ionosphere and the magnetosphere in the polar regions [1984, eng] K-30494
SSC-associated magnetic variations at the geosynchronous altitude [1984, eng] K-30495
Auroral X-ray pulsations associated with VLF pulsations [1984, eng] K-30497
Spectral behaviour of disturbances observed in the southern auroral zone [1982, eng] K-30574
Upper atmosphere particle effects [1983, ger] K-30758
Evening to morning asymmetries of electron precipitation at auroral latitudes [1983, ger] K-30759

Geomagnetic field
Paleomagnetic significance of the Foca nunataks [1983, spa] E-29482
Paleomagnetic study with sedimentary rocks from James Ross Island [1983, spa] E-29484
Toward a Quaternary time scale [1980, eng] E-31330
Plate tectonics of the Scotia Sea region [1970, eng] E-31473
Natural remanent magnetization of the Napier Complex in Enderby Land, East Antarctica [1984, eng] E-31593
Geomagnetic variations and their connection with the interplanetary magnetic field [1980, rus] K-29430
Interplanetary magnetic field polarities [1980, rus] K-29431
Preliminary study of antarctic magnetic data [1983, eng] K-29448
VLF emissions from Siple Station [1983, eng] K-29472
Geomagnetic pulsations in the polar cusp [1983, rus] K-29653
Synoptic model of ionospheric anomalies [1983, rus] K-29654
Antarctic research by satellite link [1984, eng] K-29670
Geomagnetic data from the project "Geophysical polygon in Antarctica" [1983, rus] K-29736
Upper atmosphere physics data, Syowa Station, 1981 [1984, eng] K-29980
Invariant geomagnetic co-ordinates for epoch 1977.25 [1983, eng] K-30147
Ionospheric E region anomalies in the polar caps [1983, rus] K-30354
Methods for determining the height of maximum electron concentration of the *F2*-layer [1983, eng] K-30721
Nearly simultaneous observations of the conjugate polar cusp regions [1984, eng] K-30935
Large simultaneous disturbances (LSDs) in the antarctic ionosphere [1984, eng] K-31072
Assessment of reliability of solar-terrestrial relationships from data on sectorial structure of the interplanetary magnetic field using T-criterion in the method of superimposed epochs [1985, rus] K-31668
Some structural features of the Antarctic Ocean and Antarctica according to gravity data [1974, eng] L-31442

ANOMALIES
New geophysical and geological data in the Weddell Sea [1983, eng] E-29120
Indira Mount—an underwater mountain in the antarctic ocean [1983, eng] E-29453
Geomorphologic, seismic and magnetic study of the coast of Queen Maud Land [1983, eng] E-29454
Australian-Antarctic sector of the southern ocean [1982, eng] E-29865
Geological and geophysical surveys in the Ross Sea [1984, eng] E-30916
Aeromagnetic survey over the Shirase Glacier [1983, eng] F-29112
Regional aeromagnetic survey of the northwestern Weddell Sea, Antarctica [1984, eng] J-31234
Magnetic anomalies over Antarctica measured from MAGSAT [1983, eng] L-29614
Interpretation of geophysical surveys, Molodezhnaya to Mawson Stations [1983, eng] L-29618
Paleomagnetism of volcanic rocks form Marie Byrd Land [1983, eng] L-29626
Qualitative interpretation of magnetic measurements near Schirmacher Ponds [1983, ger] L-30757
Magnetic anomalies—India and Antarctica [1984, eng] L-31152
Geomagnetic measurements in the Schirmacher region [1984, ger] L-31236
Magnetic anomalies along the traverse route between Showa and Mizuho Stations [1984, eng] L-31597
Aeromagnetic measurements of the Filchner Ice Shelf and near Georg von Neumayer Station as part of the 1983/84 Filchner Ice Shelf Project [1985, ger] L-31615
CONJUGACY
Temporal variations in the Siple Station conjugate area [1984, eng] K-30313
Harmonic structure of Pc 3-5 magnetic pulsations [1984, eng] K-30350
Proceedings of the sixth symposium on coordinated observations of the ionosphere and the magnetosphere in the polar regions [1984, eng] K-30494
SSC-associated magnetic variations at the geosynchronous altitude [1984, eng] K-30495
Conjugate observation of periodic VLF emissions near L=6 [1984, eng] K-30496
Operation plan for the Iceland-Syowa conjugate campaign in 1983-1985 [1984, eng] K-30498
Conjugate magnetic pulsation studies at Siple, Roberval, and DE-1 [1983, eng] K-30956
See also: Conjugate points
MAPS AND CHARTS
Ionospheric F2 region particle precipitation near South-Atlantic magnetic anomaly [1982, eng] K-30575
Magnetic anomalies over Antarctica measured from MAGSAT [1983, eng] L-29614
Aeromagnetic surveys around Showa Station [1984, eng] L-29928
Magnetic anomalies—India and Antarctica [1984, eng] L-31152
SECULAR VARIATIONS
Interplanetary magnetic field sector polarity data for 1979 and 1980 [1982, rus] K-28982
Evening to morning asymmetries of electron precipitation at auroral latitudes [1983, ger] K-30759
Secular motion of the south magnetic pole [1983, eng] L-29631
SURVEYS
BMR surveys of the southeast Indian Ocean [1983, eng] L-29590
Interpretation of geophysical surveys, Molodezhnaya to Mawson Stations [1983, eng] L-29618
Aeromagnetic survey of Alexander Island [1983, eng] L-31048
Magnetic and gravity surveys of Graham Land [1983, eng] L-31051

Geomagnetic field
SURVEYS *(cont.)*
Geomagnetic measurements in the Schirmacher region [1984, ger] L-31236
Aeromagnetic measurements of the Filchner Ice Shelf and near Georg von Neumayer Station as part of the 1983/84 Filchner Ice Shelf Project [1985, ger] L-31615
TRANSIENT VARIATIONS
Short-period magnetic pulsations and VLF emissions [1984, eng] K-29966
Temporal variations in the Siple Station conjugate area [1984, eng] K-30313

Geomagnetism
NESDIS environmental inventory No.1. Environmental data inventory for the antarctic area [1984, eng] A-31031
Geophysical investigations carried out by the GDR in Antarctica [1984, eng] C-30803
Marine geophysical survey, Davis to Mawson Stations [1983, eng] E-29619
Marine geophysical work during Antarctic II/4 [1984, eng] E-31163
Geomagnetic field measurement facility at Novolazarevskaya [1984, ger] K-31326
Magnetic studies of upper crustal structure in West Antarctica and the boundary with East Antarctica [1983, eng] L-29555
Antarctic crustal structure from geophysical evidence [1983, eng] L-29613
Aeromagnetic study of the Australia-Antarctic Discordance [1983, eng] L-29632
See also: Paleomagnetism
INSTRUMENTS
Utilization of wind power for the Japanese automated stations [1983, eng] G-31554
Operation plan for the Iceland-Syowa conjugate campaign in 1983-1985 [1984, eng] K-30498
Qualitative interpretation of magnetic measurements near Schirmacher Ponds [1983, ger] L-30757
Aeromagnetic survey of Alexander Island [1983, eng] L-31048

Geomorphology
Shore types of Victoria Land, Ross Dependency, Antarctica [1984, eng] C-30151
Landsat images of Antarctica [1981, eng] C-31135
Geologic observations on the Antarctic continental margin: applications to exploration in high latitude seas [1979, eng] E-28962
Bottom contours near the Antarctic Peninsula and South Shetland Islands [1982, rus] E-28972
Geomorphology of the underwater Discovery mountains [1982, rus] E-28973
Rock glaciers in southern Victoria Land [1983, eng] E-28983
Geological history of the Scotia Arc and the Antarctic Peninsula [1979, spa] E-28995
Deformation of granitic plutons in eastern Palmer Land [1983, eng] E-29071
Geocryogenic morphology at Seymour Island (Marambio) Antarctica: a progress report [1983, eng] E-29079
Mélange on Fredriksen Island, South Orkneys [1983, eng] E-29110
Geomorphology at Lützow-Holm Bay [1983, eng] E-29122
Petrography of a discordant metabasite from the Skallen Hills [1983, eng] E-29123
Metamorphic rocks in the Queen Fabiola Mountains [1983, eng] E-29126
Landforms of Mount Riiser-Larsen, Amundsen Bay [1983, eng] E-29129
Morphology of lenitic environment on Potter Peninsula [1983, spa] E-29136
Scotia metamorphic complex at Cape Bowles, Clarence Island [1984, eng] E-29395
Continental drift and Late Cenozoic glaciation of Antarctica [1980, rus] E-29413
Relief and glaciation of the southern portion of Prince Charles Mountains [1980, rus] E-29425
Spatial relationship of antarctic glacier and rock reliefs [1980, rus] E-29427
Study of sediments on and off Queen Maud Land coast [1983, eng] E-29446
Geomorphologic, seismic and magnetic study of the coast of Queen Maud Land [1983, eng] E-29454
Slopes, hillsides, and walls on the Antarctic Peninsula [1983, ger] E-29514
Precambrian geological evolution in East Antarctica [1983, eng] E-29518
Metamorphism and tectonism of the Napier and Rayner complexes [1983, eng] E-29521
Geology and petrology of Prince Olav Coast [1983, eng] E-29523
Reassessment of the age of the Windmill Metamorphics, Casey area [1983, eng] E-29532
Lithology and Sr-Nd isotopes in the Vestfold Block [1983, eng] E-29533
Development and changes in rocks in Vestfold Hills [1983, eng] E-29534
East Antarctica-West Antarctica Boundary between the ice shelves: a review [1983, eng] E-29535
Geology of Terra Nova Bay [1983, eng] E-29546
Type locality of the Ackerman Formation, La Gorce Mountains [1983, eng] E-29550

Moraine formation in glacier ablation areas [1983, eng] **F-29132**
Basal sliding of Shirase Glacier [1983, jpn] **F-29218**
Subglacial morphology from Ellsworth Mountains to the Antarctic Peninsula [1983, eng] **F-29568**
Late Quaternary ice flow across Vestfold Hills [1983, eng] **F-29607**
On late-glacial and holocene glacier fluctuations in maritime West Antarctica [1983, eng] **F-29863**
Surges of the Denman outlet glacier and their relations to the state of the Shackleton Ice Shelf in Antarctica [1983, rus] **F-29936**
Statistical characteristics of variations in the movements of polar ice streams [1982, ger] **F-30157**
Glacier flexure and the position of grounding lines: measurements by tiltmeter on Rutford Ice Stream, Antarctica [1984, eng] **F-30483**
Results of geodetic-glaciological work on Hays Glacier [1983, ger] **F-30762**
Satellite measurement of antarctic glacier drift [1984, ger] **F-30878**
Glacier fluctuations in South Georgia, 1883-1974 [1983, eng] **F-31039**
Glaciological characteristics of Spartan Glacier, Alexander Island [1983, eng] **F-31047**
Borehole geometry on the Greenland and Antarctic ice sheets [1985, eng] **F-31229**
Rheology of glacier ice [1985, eng] **F-31285**

HEAT EXCHANGE
Summer heat and ice balances on Hodges Glacier, South Georgia [1982, eng] **F-29844**
Ice, water and energy balances of Spartan Glacier, Alexander Island [1983, eng] **F-31044**
Ice dynamics and thermal regime of Taylor Glacier [1984, eng] **F-31171**

MAGNETIC EXPLORATION
Aeromagnetic survey over the Shirase Glacier [1983, eng] **F-29112**

MASS BALANCE
Investigation of the antarctic ice cover [1983, ger] **F-29697**
Summer heat and ice balances on Hodges Glacier, South Georgia [1982, eng] **F-29844**
Ice mass fluctuations in northern Victoria Land [1983, eng] **F-30403**
Glacier flexure and the position of grounding lines: measurements by tiltmeter on Rutford Ice Stream, Antarctica [1984, eng] **F-30483**
Results of geodetic-glaciological work on Hays Glacier [1983, ger] **F-30762**
Ice, water and energy balances of Spartan Glacier, Alexander Island [1983, eng] **F-31044**
Glaciological characteristics of Spartan Glacier, Alexander Island [1983, eng] **F-31047**
Ice dynamics and thermal regime of Taylor Glacier [1984, eng] **F-31171**
Radar measurements of atmospheric precipitation in Antarctica [1984, rus] **I-31641**

MECHANICAL PROPERTIES
Statistical characteristics of variations in the movements of polar ice streams [1982, ger] **F-30157**
Ice dynamics and thermal regime of Taylor Glacier [1984, eng] **F-31171**

MORPHOLOGY
Landsat images of Antarctica [1981, eng] **C-31135**
Portrait of an antarctic outlet glacier [1983, eng] **F-29048**
Moraine formation in glacier ablation areas [1983, eng] **F-29132**

PHYSICAL PROPERTIES
Thermal properties and the mechanics of natural ice [1983, rus] **F-29186**
Proton mobility in hexagonal ice from Antarctic cores [1983, eng] **F-29236**
Physical and chemical studies on ice from glaciers and ice sheets [1974, jpn] **F-30358**
Antarctic ice berths [1984, rus] **F-30867**

SOUNDINGS
Ice mass fluctuations in northern Victoria Land [1983, eng] **F-30403**
Radar wave speeds in polar glaciers [1983, eng] **G-29099**

STRUCTURE
Distribution of ice crystal c-axes [1974, jpn] **F-30368**
Density and rheological properties of glacier ice [1985, rus] **F-31661**

SURFACE FEATURES
Geological interpretation of satellite photographs of antarctic mountain regions [1985, rus] **E-31655**

TEMPERATURE
Freezing of sea water in shelf glaciers [1962, rus] **F-30323**

THAWING
Glaciological and geocryological studies on King George Island [1984, rus] **F-30849**

THICKNESS
Basal sliding of Shirase Glacier [1983, jpn] **F-29218**
Results of geodetic-glaciological work on Hays Glacier [1983, ger] **F-30762**
Glaciological and geocryological studies on King George Island [1984, rus] **F-30849**
Ice thickness on cirque glaciers in the Yamato Mountains [1984, eng] **F-30910**
Glaciological characteristics of Spartan Glacier, Alexander Island [1983, eng] **F-31047**

VARIATIONS
Glacial geology and soils in Beacon Valley [1983, eng] **E-30397**
On late-glacial and holocene glacier fluctuations in maritime West Antarctica [1983, eng] **F-29863**

History of antarctic research [1984, ger] A-31323
Fernández de Quirós: the determined seeker of Terra Australis [1985, spa] A-31421
Argentine army's 30 years of antarctic activity [1982, spa] A-31480
King George and Elephant islands [1985, por] A-31628
Conservation and the Antarctic [1984, eng] B-30990
Sheld-geese and man in the Falkland Islands [1984, eng] B-31712
German contributions to antarctic cartography [1984, ger] C-30875
British, Australian and New Zealand Antarctic Research Expedition of 1929-1931 [1984, eng] D-30195
Under Scott's command: Lashly's Antarctic diaries [1969, eng] D-30491
Adventure in the Antarctic [1978, nor] D-30880
Ernest Shackleton's incredible adventure [1982, spa] D-31477
Experience of Polish ocean lines in the service of antarctic expeditions [1981, pol] G-29983
Dakotas in the Antarctic; a study in versatility [1971, eng] G-31438
Satellite observations over Antarctica [1984, eng] I-30802
Antarctic circumpolar ocean [1984, eng] J-31435
Chile, the Antarctic Treaty and its system [1983, spa] M-29898
National security and the Austral Crescent [1984, eng] M-30381
Chile's extracontinental projection [1984, spa] M-31345
Chile's presence in the Antarctic [1984, spa] M-31346
Historical tie between the continental territory and Antarctica [1984, spa] M-31347
Historic records of Chilean international policies in Antarctica. 1906, 1907 and 1908 negotiations between Chile and Argentina [1984, spa] M-31348

Humidity

Quantitative analysis of snow-line zonality [1984, chi] F-31139
Long wave atmospheric radiation under cloudy and cloudless conditions [1982, rus] I-28969
Extremely low air temperature at Mizuho Station [1983, eng] I-29262
Cloud parameters from upper air soundings [1983, rus] I-29501
Cycle of Southern Hemisphere atmospheric energy [1983, eng] I-29507
Heat and moisture Balance and glaciation [1983, rus] I-29647
Climate monitoring in Antarctica [1983, rus] I-29648
Model of the antarctic sink for stratospheric water vapor [1980, eng] I-29805
Deuterium as related to water vapor and precipitation at Schirmacher Ponds [1984, eng] I-30452
Cloud parameters from upper air soundings [1983, eng] I-30557
Measurements of atmospheric carbon dioxide over the ocean [1984, rus] I-30869
Terrestrial refraction over the ice sheet of Enderby Land [1981, ger] I-30907
Precipitation regime of the west antarctic ice sheet [1984, eng] I-31108
Near surface meteorological experiment at the Filchner ice front [1984, ger] I-31169
Distribution of atmospheric energy [1982, eng] I-31645

Hydrography

Large-scale hydrography and krill distribution in the southern ocean [1984, eng] B-31214
Hydrographic chart of the Schirmacher Ponds region [1983, ger] C-30764
Quantification of morphotypes in *Neogloboquadrina pachyderma* using Fourier shape analysis [1983, eng] E-30519
First Post-FIBEX Hydrographic Data Interpretation Workshop [1982, eng] J-29191
Second Post-FIBEX Hydrographic Data Interpretation Workshop [1983, eng] J-29192
Hydrographic data from the US-USSR Weddell Polynya Expedition [1983, eng] J-29212
Summer ocean structure off Queen Maud Land [1983, eng] J-29273
Chemistry of southwestern portion of Indian Ocean [1983, eng] J-29440
Current status and problems of southern ocean studies [1983, rus] J-29650

Ross Sea heat flux experiment field activities [1983, eng] J-30516
Weddell Gyre [1983, eng] J-30517
Physical oceanography of the eastern Scotia Sea [1984, eng] J-30596
Characteristics of a salinity front in the eastern Bransfield Strait, the source region of the Weddell-Scotia Confluence [1983, ger] J-31094
Oceanographic data collected aboard R/V *Melville* during Jan.-Feb. 1979 and AGS *Yelcho* during Apr.-May 1979 as a part of DRAKE 79 [1979, eng] J-31101
Hydrographic investigations at the edge of the Filchner Ice Shelf [1984, ger] J-31165
Hydrography at the edge of Filchner Ice Shelf [1985, ger] J-31613

Two-dimensional, seasonal, energy balance climate model with continents and ice sheets: testing the Milankovitch theory [1984, eng] F-30026
On the motion of continental ices [1981, eng] F-30058
Ice dynamics at Dome C, East Antarctica [1984, eng] F-30379
Model of interactions between ice stream, ocean and solid ground in West Antarctica [1983, eng] F-30437
Symposium on Ice and Climate Modeling, 1983 [1984, eng] F-30478
A three-dimensional time-dependent model of the West Antarctic ice sheet [1984, eng] F-30479
Cross-sectional model for West Antarctica [1984, eng] F-30482
Observing polar-ice variability [1984, eng] F-30485
Interactions between polar ice streams and the sea [1984, eng] F-30503
Flow law for isotropic and anisotropic ice at low strain rates [1984, eng] F-30567
Two-phase model of electrical conduction in polar ice sheets [1984, eng] F-30595
Ice dynamics [1984, eng] F-30815
Handbook for sea ice analysis and forecasting [1984, eng] F-30881
West antarctic sea ice [1984, eng] F-31106
Sea ice variations around West Antarctica [1984, eng] F-31114
Polar ice sheets: developments since Wegener [1981, eng] F-31136
Model of ice breakup in the marginal ice zone [1985, eng] F-31461
Interactions between ice shelves and earth [1985, eng] F-31462
Quaternary paleoclimatology. Methods of paleoclimatic reconstruction [1985, eng] F-31647
Density and rheological properties of glacier ice [1985, rus] F-31661
Ice-sheet modelling for climate studies [1983, eng] F-31741
Climate processes and climate sensitivity [1984, eng] I-30280
Role of sea ice dynamics in modeling CO2 increases [1984, eng] I-30283
Antarctic sea ice and atmospheric temperature increases [1984, eng] I-30284
Drag coefficient across the Antarctic marginal ice zone [1984, eng] I-30549
Response of a climate model to orbital variations [1982, eng] I-31299
Numerical simulations of the Ross Sea tides [1984, eng] J-29228
Analysis of geophysical data from Dome C and the Ross Ice Shelf [1983, eng] L-30398
PHYSICAL PROPERTIES
Some experimental results on snow compaction [1983, eng] F-29107
Effects of hydrostatic pressure on the rate of grain growth in Antarctic polycrystalline ice [1983, eng] F-29233
Isotopic effects during snow formation [1984, eng] F-31075
Quaternary paleoclimatology. Methods of paleoclimatic reconstruction [1985, eng] F-31647
Model tests and in situ behaviour of prestressed anchors in snow and ice [1984, eng] G-31238
Ice plug anchor—development of a new anchor for use in snow and ice [1985, eng] G-31474
Microanalysis of an East Antarctic ice core for paleoclimate reconstruction models [1983, eng] I-29726
POLLUTION
Ions at ultratrace levels in antarctic snow and ice [1984, eng] F-29705
Use of the method of isotope glaciology for studying nuclear explosion products in Antarctica [1982, eng] F-30059
Radioactive dating of Byrd core and Allan Hills ice [1983, eng] F-30402
South Pole ice core processing and microparticle analysis [1983, eng] F-30407
RADIATION
Hydrometeorological characteristics of snow and ice over Antarctica [1983, eng] F-29433
RADIOACTIVITY
Glaciological studies during the First Indian Antarctic Expedition [1983, eng] F-29450
Use of the method of isotope glaciology for studying nuclear explosion products in Antarctica [1982, eng] F-30059
STRATIGRAPHY
Stratigraphy and density data from ice core drilled at G2 grid station [1984, eng] F-30044
Deep ice cores from Antarctica [1974, jpn] F-30367
Studies of ice formation and ice fabric on the Law Dome, Antarctica [1984, chi] F-30830
STRUCTURE
Deep ice cores from Antarctica [1974, jpn] F-30367
Microparticles in ice cores from Antarctica and Greenland [1984, chi] F-30831
SURFACE FEATURES
Exploration for meteorite concentrations in the Thiel Mountains/-Pecora Escarpment region, 1982-1983 [1983, eng] E-30389
TEMPERATURE
Evolution of McMurdo Sound mountain glaciers [1980, rus] F-29420
Satellite-derived ice data sets. No. 1: Antarctic monthly average microwave brightness temperatures and sea ice concentrations, 1973-1976 [1981, eng] F-29825
Ice dynamics at Dome C, East Antarctica [1984, eng] F-30379
THICKNESS
Hydrology and glaciology of the dry valleys, 1980-81 [1983, eng] E-30996
Archaean and Late Proterozoic rocks on Princess Elizabeth Land [1982, eng] E-31012
West antarctic ice sheet: diagnosis and prognosis [1983, eng] F-29973
Station position, elevation and ice thickness between Syowa and Mizuho stations [1984, eng] F-30041
Glacier flexure and the position of grounding lines: measurements by tiltmeter on Rutford Ice Stream, Antarctica [1984, eng] F-30483
Late-glacial maximum-Holocene atmospheric and ice-thickness changes from Antarctic ice-core studies [1984, eng] I-30481
VARIATIONS
Antarctic ice charts 1981-1982 [1982, eng] F-29855
VOLUME
West antarctic ice sheet: diagnosis and prognosis [1983, eng] F-29973
Antarctic sea ice and atmospheric temperature increases [1984, eng] I-30284

Ice breaking
Deep Freeze 1984 Cruise Report [1984, eng] G-30140
Coast Guard ice breaking operations [1984, eng] G-30328
Ship operations, 1982-1983 [1983, eng] G-30972
See also: Icebreakers

Ice-free areas
Drilling in eastern Taylor Valley, 1982-83 [1984, eng] E-29489
Preliminary abrasion rate observations in Victoria Valley, Antarctica [1983, eng] E-30233
Reconnaissance geological investigation of basement units, McMurdo Sound region [1983, eng] E-30242
Unusual periglacial features on Seymour Island, Antarctic Peninsula [1983, eng] E-30253
Hydrology and hydrochemistry of Schirmacher Ponds [1984, eng] E-30453

Ice-free areas *(cont.)*
  - Isotope hydrology and hydrochemistry of Lake Unter-See [1984, eng] E-30454
  - Isotope variations in flora from the Schirmacher Ponds region [1984, rus] E-30871
  - Unconsolidated deposits in the Langhovde and Skarvsnes areas [1983, eng] F-29128
  - *See also:* Polynyas

Ice sheet

  - Baseline acidity of ancient precipitation from the South Pole [1984, eng] F-30570
  - Two-phase model of electrical conduction in polar ice sheets [1984, eng] F-30595
  - Study of the granulometric composition of ice core trace elements at Vostok Station by an electrooptical method [1984, rus] F-30866

C-13/C-12 ratios in CO2 extracted from antarctic ice [1984, eng] F-31088
Measurements of hydrogen peroxide in polar ice samples [1984, eng] F-31460
Soluble impurities in the Byrd Station ice core [1985, eng] F-31463
Trapping of xenon in ice: implications for the origin of Earth's noble gases [1984, eng] F-31680
Pu-240/Pu-239 ratio, a potential geochronometer [1985, eng] F-31681
Record of global pollution in polar snow and ice [1985, eng] F-31682
Isotope distribution and glaciology of the Schirmacher Ponds region [1984, eng] I-30455

CORES
Ice core samples from Greenland and Antarctica [1983, eng] F-29043
Data on past air composition from ice cores of Greenland and Byrd Station, Antarctica [1983, eng] F-29234
Bubble close-off density of antarctic ice [1983, eng] F-29274
Record of past atmospheric CO2 from tree-ring and ice core studies [1983, eng] F-29493
Measurement of CO2 in a Dome C ice core [1983, eng] F-29803
Antarctic ice sheet surface oxygen isotope values [1982, eng] F-29845
Ocean [1983, eng] F-29876
Antarctic ice: the frozen time capsule [1983, eng] F-29919
Mechanics of Byrd Station ice core samples [1974, jpn] F-30359
Baseline acidity of ancient precipitation from the South Pole [1984, eng] F-30570
C-13/C-12 ratios in CO2 extracted from antarctic ice [1984, eng] F-31088
Data from antarctic ice cores on CO2, climate, aerosols, and changes in ice thickness [1984, eng] F-31103
Relationship between bore hole closure and ice crystal structure [1984, eng] F-31173
Measurements of hydrogen peroxide in polar ice samples [1984, eng] F-31460
Soluble impurities in the Byrd Station ice core [1985, eng] F-31463
Record of global pollution in polar snow and ice [1985, eng] F-31682

CRYSTALS
Mechanics of Byrd Station ice core samples [1974, jpn] F-30359
Relationship between bore hole closure and ice crystal structure [1984, eng] F-31173

DEFORMATION
Deformation within polar ice sheets [1983, eng] F-29098
Thermal properties and the mechanics of natural ice [1983, rus] F-29186
A three-dimensional time-dependent model of the West Antarctic ice sheet [1984, eng] F-30479
Cross-sectional model for West Antarctica [1984, eng] F-30482
Determination of the bearing capacity of antarctic ice [1984, rus] F-30868
Relationship between bore hole closure and ice crystal structure [1984, eng] F-31173

DENSITY
Bubble close-off density of antarctic ice [1983, eng] F-29274

DESTRUCTION
Modeling the cryospheric response [1983, eng] F-29494
Changes in sea level because of increased atmospheric CO2 [1983, eng] F-29496
Sea and ocean level fluctuations for 15,000 years [1982, rus] J-30741
Studies of ocean level fluctuations during postglacial time [1982, rus] J-30742
Antarctic and Greenland ice sheets and the level of world ocean [1982, rus] J-30743

DISTRIBUTION
Snow and ice mapping in Antarctica, Iceland and Cape Cod [1983, eng] F-29310
Basic morphology and variations of antarctic ice shores [1983, rus] F-29651
Symposium on Ice and Climate Modeling, 1983 [1984, eng] F-30478
Climate sensitivity and the marginal cryosphere [1984, eng] I-30282
West Antarctica, the sea-level controlled marine instability [1984, eng] I-30286
Climatic changes in both hemispheres and bipolar interglacial warming [1984, eng] I-30287

DRILLING
Study of subglacial lake in the region of the Molodezhnaya Station [1978, eng] E-30056
Deformation within polar ice sheets [1983, eng] F-29098
Ice core science trench for use by glaciologists on the Greenland ice sheet [1983, eng] F-31561
Model tests and in situ behaviour of prestressed anchors in snow and ice [1984, eng] G-31238
Radar measurements of ice sheet boreholes [1985, eng] G-31578

ELECTRICAL PROPERTIES
Two-phase model of electrical conduction in polar ice sheets [1984, eng] F-30595

FLOW
Glacial marine sedimentation model from antarctic Quaternary deposits [1983, eng] E-29199
Ice sheet overriding of the Transantarctic Mountains [1983, eng] E-30394
Ablation and ice movement at the Allan Hills Main Icefield between 1978 and 1981 [1984, eng] E-31000
Meteorites in antarctic ice [1984, fre] E-31731
Ice sheet flow velocity, Showa to Mizuho Stations [1983, eng] F-29131
Allan Hills meteorite icefield triangulation net [1983, eng] F-29633
Ice sheets and climate [1984, eng] F-29820
Antarctic ice sheet: aspects of current configuration and flow [1983, eng] F-29939
Global thermodynamics of a polar ice sheet [1984, eng] F-30027
On the motion of continental ices [1981, eng] F-30058
Apparatus for measuring ice under high pressure [1974, jpn] F-30362
A three-dimensional time-dependent model of the West Antarctic ice sheet [1984, eng] F-30479
Cross-sectional model for West Antarctica [1984, eng] F-30482
Ice sheets on the move [1984, eng] F-30671
Doppler satellite measurements on the Antarctic Peninsula [1985, ger] F-31624

FORMATION
Frozen Antarctica—ice-free Arctic: past and future [1982, ger] A-31306
Continental drift and Late Cenozoic glaciation of Antarctica [1980, rus] E-29413
Problems in antarctic marine geology: a review [1983, eng] E-29588
No evidence of mass faunal extinction in microtektite horizons (Upper Eocene) [1983, eng] E-30411
Global temperature trend in the Cenozoic [1981, eng] I-29148
Climate and ice sheets [1982, eng] I-30020

HEAT EXCHANGE
Energy balance, an index of antarctic glaciation [1983, eng] F-29075
Ice sheets and climate [1984, eng] F-29820
Heat and moisture Balance and glaciation [1983, rus] I-29647
Interaction of atmosphere, ice, and ocean in Antarctica [1982, fre] I-30436

MASS BALANCE
Towards an inventory of the great ice sheets [1983, eng] C-29702
Geologic observations on the Antarctic continental margin: applications to exploration in high latitude seas [1979, eng] E-28962
Model of ice sheet evolution [1982, rus] F-28970
Investigation of the antarctic ice cover [1983, ger] F-29697
Accumulation and mass balance of the large ice-catchment basin in East Antarctica [1983, rus] F-29935
Antarctic ice sheet: aspects of current configuration and flow [1983, eng] F-29939
Global thermodynamics of a polar ice sheet [1984, eng] F-30027
A three-dimensional time-dependent model of the West Antarctic ice sheet [1984, eng] F-30479
Cross-sectional model for West Antarctica [1984, eng] F-30482

MECHANICAL PROPERTIES
Deformation within polar ice sheets [1983, eng] F-29098
Basal sliding of Shirase Glacier [1983, jpn] F-29218
Ice sheet linkage between regional radiation and global climate [1983, eng] F-29361
Mechanics of Byrd Station ice core samples [1974, jpn] F-30359
Apparatus for measuring ice under high pressure [1974, jpn] F-30362

Ice sheet
MECHANICAL PROPERTIES *(cont.)*
Ice sheets on the move [1984, eng] F-30671
Polar ice sheets: developments since Wegener [1981, eng] F-31136
Relationship between bore hole closure and ice crystal structure [1984, eng] F-31173
Borehole geometry on the Greenland and Antarctic ice sheets [1985, eng] F-31229
JARE glaciological research in Queen Maud Land, 1983 [1984, eng] F-31496
MORPHOLOGY
Landforms of Mount Riiser-Larsen, Amundsen Bay [1983, eng] E-29129
Unconsolidated deposits in the Langhovde and Skarvsnes areas [1983, eng] F-29128
PHYSICAL PROPERTIES
Physical and chemical studies on ice from glaciers and ice sheets [1974, jpn] F-30358
Apparatus for measuring ice under high pressure [1974, jpn] F-30362
Symposium on Ice and Climate Modeling, 1983 [1984, eng] F-30478
A three-dimensional time-dependent model of the West Antarctic ice sheet [1984, eng] F-30479
Cross-sectional model for West Antarctica [1984, eng] F-30482
Determination of the bearing capacity of antarctic ice [1984, rus] F-30868
Polar ice sheets: developments since Wegener [1981, eng] F-31136
POLLUTION
Ecological aspects of exploitation of Antarctica's mineral resources [1984, eng] E-30448
Detailed studies of tephra layers in the Byrd Station ice core: Preliminary results and interpretation [1983, eng] F-30401
Pu-240/Pu-239 ratio, a potential geochronometer [1985, eng] F-31681
Record of global pollution in polar snow and ice [1985, eng] F-31682
RADIATION
Energy balance, an index of antarctic glaciation [1983, eng] F-29075
SEISMIC EXPLORATION
Geological interpretation of satellite images of Antarctica [1983, rus] E-29292
Upper crustal structure of the Prince Olav Coast, East Antarctica [1984, eng] F-30099
SOUNDINGS
Study of subglacial lake in the region of the Molodezhnaya Station [1978, eng] E-30056
Radio echosounding of sub-ice bedrock near the Yamato Mountains [1984, eng] E-30917
Geoelectric soundings near Dome C [1983, ger] F-29104
Analysis of geophysical data from Dome C and the Ross Ice Shelf [1983, eng] L-30398
STRATIGRAPHY
Record of ice levels contained in volcanic rocks of Marie Byrd Land [1983, eng] E-29641
Seismic velocity of the ice sheet on Prince Olav Coast [1984, eng] F-30101
SUBLIMATION
Ice-sheet melting and sea level [1983, eng] F-29201
SURFACE FEATURES
Evaluation of Landsat 3 RBV images for earth science studies in Antarctica [1983, eng] C-29602
Geological interpretation of satellite images of Antarctica [1983, rus] E-29292
Glaciological studies on the traverse to Dome C [1983, rus] F-29728
Surface slopes of the ice sheet [1984, eng] F-30045
Glacial geomorphology between Breid Bay and Sör Rondane Mountains, Queen Maud Land [1984, eng] F-31594
Katabatic wind forcing of the Terra Nova Bay polynya [1984, eng] I-30382
TEMPERATURE
Geoelectric soundings near Dome C [1983, ger] F-29104
Ice dynamics at Dome C, East Antarctica [1984, eng] F-30379
THAWING
Estimates of future sea level rise [1984, eng] F-31694
Major climatic events associated with a prolonged CO2-induced warming [1981, eng] I-31441
THICKNESS
Using soils to study McMurdo area ice thickness [1983, eng] E-29605
Ice sheet thickness on Lassiter Coast [1983, eng] E-30393
Geological map of Antarctica, scale 1:5,000,000 [1976, rus] E-31032

See under: Ionosphere

Ionosphere
Spring meeting 1983, abstracts [1983, eng] A-30203

Ionosphere *(cont.)*

- NESDIS environmental inventory No.1. Environmental data inventory for the antarctic area [1984, eng] A-31031
- Zonal average thermosphere [1984, eng] I-30501
- Global distribution of thermospheric odd nitrogen [1984, eng] I-30502
- New ionosonde for the Faraday Station ionospheric laboratory [1984, eng] K-29393
- Siple VLF transmitter signals outside the plasmapause [1983, eng] K-29411
- VLF emissions from Siple Station [1983, eng] K-29472
- Antarctic research by satellite link [1984, eng] K-29670
- L-band satellite communication experiment in the Antarctic [1982, ger] K-29850
- Polar magnetic disturbances and field-aligned currents [1982, eng] K-30018
- Cosmic noise records from Showa Station, 1982 [1984, eng] K-30036
- Proceedings of the sixth symposium on coordinated observations of the ionosphere and the magnetosphere in the polar regions [1984, eng] K-30494
- Studies on the complex of electromagnetic phenomena in the Antarctic [1984, eng] K-30632
- Aurora and polar upper atmosphere [1983, jpn] K-31634

ABSORPTION

- Coupling between magnetic activity and ionospheric absorption [1983, spa] K-29151
- Influence of the interplanetary environment on auroral zones [1983, spa] K-29152
- Upper atmosphere physics data, Syowa Station, 1981 [1984, eng] K-29980
- Spectral behaviour of disturbances observed in the southern auroral zone [1982, eng] K-30574
- Variations of high latitude ionospheric plasmas [1984, ger] K-30740
- Ionospheric observations of a GDR group during the 21st Soviet Antarctic Expedition 1975-1977 [1979, ger] K-30882
- Riometry in Antarctica [1983, eng] K-30946
- Day to night absorption ratio in auroral and subauroral zone riometer measurements during auroral absorption [1984, eng] K-31057

CURRENT SYSTEMS

- Magnetic effects of vortical currents [1983, spa] K-29479
- Morning Pi 1 and field aligned currents [1984, eng] K-30500

D REGION

- *In situ* measurements of transionospheric VLF wave injection [1983, eng] K-29001
- Radiowave transmission characteristics in Antarctica [1983, eng] K-29437
- Day to night absorption ratio in auroral and subauroral zone riometer measurements during auroral absorption [1984, eng] K-31057

DIURNAL VARIATIONS

- Sporadic *E(Es)* associated with the main ionospheric trough observed over Halley Station, Antarctica [1984, eng] K-30112
- Study of oxygen red line in twilight [1984, rus] K-30180
- Evening to morning asymmetries of electron precipitation at auroral latitudes [1983, ger] K-30759
- Ionograms of electron density SANAE to Grahamstown [1984, eng] K-31073

E REGION

- Standing wave patterns in VLF hiss [1983, eng] K-29000
- Studies of sporadic E associated with the main ionospheric trough [1983, eng] K-29474
- Magnetic effects of vortical currents [1983, spa] K-29479
- Sporadic *E(Es)* associated with the main ionospheric trough observed over Halley Station, Antarctica [1984, eng] K-30112
- Ionospheric E region anomalies in the polar caps [1983, rus] K-30354
- Large simultaneous disturbances (LSDs) in the antarctic ionosphere [1984, eng] K-31072

ELECTRON DENSITY

- Atmospheric research in Antarctica [1984, eng] I-31401
- Standing wave patterns in VLF hiss [1983, eng] K-29000
- Sporadic *E(Es)* associated with the main ionospheric trough observed over Halley Station, Antarctica [1984, eng] K-30112
- Study of oxygen red line in twilight [1984, rus] K-30180
- Auroras at Novolazarevskaya [1984, ger] K-30260
- Upper atmosphere particle effects [1983, ger] K-30758
- Evening to morning asymmetries of electron precipitation at auroral latitudes [1983, ger] K-30759
- Ionospheric observations of a GDR group during the 21st Soviet Antarctic Expedition 1975-1977 [1979, ger] K-30882
- Studies of the spectral broadening effect with the Siple VLF transmitter [1983, eng] K-30953
- Observations of standing waves in VLF hiss over Siple Station [1983, eng] K-30954
- Ionograms of electron density SANAE to Grahamstown [1984, eng] K-31073
- DE 1 observations of Siple transmitter signals and associated sidebands [1985, eng] K-31691
- New VLF method for studying burst precipitation near the plasmapause [1985, eng] K-31692

F REGION

- Radio studies of the main F region trough in Antarctica [1983, eng] K-29473
- Observations of the dynamics of the polar thermosphere [1984, eng] K-30312
- Ionospheric F2 region particle precipitation near South-Atlantic magnetic anomaly [1982, eng] K-30575
- Methods for determining the height of maximum electron concentration of the *F*2-layer [1983, eng] K-30721

IONIZATION

- Studies of sporadic E associated with the main ionospheric trough [1983, eng] K-29474
- Sporadic *E(Es)* associated with the main ionospheric trough observed over Halley Station, Antarctica [1984, eng] K-30112
- Ionospheric F2 region particle precipitation near South-Atlantic magnetic anomaly [1982, eng] K-30575
- Methods for determining the height of maximum electron concentration of the *F*2-layer [1983, eng] K-30721
- Upper atmosphere particle effects [1983, ger] K-30758
- Whistler-induced perturbations of broadcast band signals [1983, eng] K-30959
- Variable frequency VLF signals in the magnetosphere: associated phenomena and plasma diagnostics [1985, eng] K-31264

IRREGULARITIES

- Synoptic model of ionospheric anomalies [1983, rus] K-29654
- Excitation of magnetostatic fluctuations by filamentation of whistlers [1984, eng] K-29746
- Records of radio aurora at Showa Station [1984, eng] K-30034
- Ionospheric E region anomalies in the polar caps [1983, rus] K-30354
- Measurement of ionospheric electron columnar content changes over McMurdo Station [1983, eng] K-30709
- Spread-*F* ionospheric irregularities and their relationship to stable auroral red arcs at magnetic mid-latitudes [1984, eng] K-30722
- Large simultaneous disturbances (LSDs) in the antarctic ionosphere [1984, eng] K-31072
- New VLF method for studying burst precipitation near the plasmapause [1985, eng] K-31692

STORMS

- Variations of high latitude ionospheric plasmas [1984, ger] K-30740

Isolation effects

- Human immune humoral response [1983, spa] H-29140
- 5-HIAA and VMA variations in Belgrano Station population [1983, spa] H-29144
- Basic results of studies on human adaptation to antarctic conditions [1983, rus] H-29660
- Arctic Environment—man and the future. Abstracts [1984, eng] H-29933

Recruitment rates of antarctic minke whales and age distribution [1982, eng] B-29781

Mark recapture method for estimation of minke whale population size [1982, eng] B-29782

Operating pattern and time budget data for antarctic minke whaling by the Japanese Expedition in 1980/81 [1982, eng] B-29783

Unbalanced sex ratio in the minke whale catch and its effect on management [1982, eng] B-29784

Thirty-third report of the International Whaling Commission [1983, eng] B-29880

Southern Hemisphere minke whale stocks [1983, eng] B-29881

Southern minke whale stock divisions [1983, eng] B-29882

Effects of age data variability on minke whale estimation [1983, eng] B-29883

Analysis of Southern Hemisphere minke whale catch and effort data [1983, eng] B-29884

Revised effort statistics for Japanese minke whaling [1983, eng] B-29888

Operating pattern of Japanese minke whaling in 1981/82 [1983, eng] B-29889

Decline in age at sexual maturity in minke whales [1983, eng] B-29890

Replacement yield to stabilize a population [1983, eng] B-29891

Simulation studies on sighting of minke whales [1983, eng] B-29892

Significance of latitude 55 S to marine mammal distribution [1984, eng] B-30902

Key role of krill in the antarctic ecosystem related to CCAMLR [1984, eng] B-31239

Adjustments to the CPUE for antarctic minke whaling [1984, eng] B-31269

Minke whale sighting data and school density estimates [1984, eng] B-31270

Hazard-rate model for sighting estimates of minke whale abundance [1984, eng] B-31271

Minke whaling by the Japanese in 1982-83 [1984, eng] B-31277

Pack ice edge data from Japanese catcher boats in the Antarctic [1984, eng] B-31278

1981-82 minke whale assessment cruise in Area 2 [1984, eng] B-31279

GEOGRAPHIC DISTRIBUTION

Distribution pattern in minke whales and sex ratio in the catch [1981, eng] B-29755

Population changes of whale bone whales in the Pacific and the Antarctic [1981, eng] B-29763

Distribution and biology of killer whales in the South Atlantic [1981, eng] B-29764

Biology and exploitation of the killer whale and recent sightings in the Antarctic [1981, eng] B-29765

Incidental records of cetaceans in southern seas January and February 1981 [1982, eng] B-29776

MARKING

Minke whale assessment cruise (IWC/IDCR) report for 1978 to 1981 [1982, eng] B-29387

Note on the abundance of antarctic blue whales [1981, eng] B-29679

Results from the IWC/IDCR minke marking and sightings cruise, 1979/80 [1981, eng] B-29749

Recoveries of whale marks from minke whales [1981, eng] B-29757

Trial firing for minke whale marking [1981, eng] B-29760

Soviet marking program for sperm whales in the Southern Hemisphere [1981, eng] B-29769

Movements of marked sperm whales in the Southern Hemisphere [1981, eng] B-29772

Southern Hemisphere marking of minke whales [1982, eng] B-29780

Mark recapture method for estimation of minke whale population size [1982, eng] B-29782

Whale sightings and marking for estimation of population size [1982, eng] B-29785

Mark-recapture estimates of population size for minke whales [1983, eng] B-29887

Shipboard estimates of minke whale length [1984, eng] B-31273

Movements of marked minke whales in the Antarctic [1984, eng] B-31276

MIGRATION

Soviet marking program for sperm whales in the Southern Hemisphere [1981, eng] B-29769

Southern Hemisphere sperm whale feeding [1981, eng] B-29770

Movements of marked sperm whales in the Southern Hemisphere [1981, eng] B-29772

Movements of marked minke whales in the Antarctic [1984, eng] B-31276

MORPHOLOGY

Carotenoid colored minke whale [1979, eng] B-29055

Gyrinomimus notius sp.n. first finding in Ross Sea [1983, rus] B-29685

Stock estimates for sperm whales using a length-specific technique [1983, eng] B-29893

Second record of spectacled porpoise from subantarctic southwest Pacific [1984, eng] B-30276

Shipboard estimates of minke whale length [1984, eng] B-31273

Age-length relationships in whales [1984, eng] B-31284

NUTRITION

Energy costs of growth, maintenance and reproduction of the female minke whale [1981, eng] B-29754

Distribution and biology of killer whales in the South Atlantic [1981, eng] B-29764

Southern Hemisphere sperm whale feeding [1981, eng] B-29770

Bioaccumulation of DDTs and PCBs in the southern minke whale *(Balaenoptera acutorostrata)* [1984, eng] B-30904

PATHOLOGY

Unusual minke whale with deformed jaw [1979, eng] B-29056

Bioaccumulation of DDTs and PCBs in the southern minke whale *(Balaenoptera acutorostrata)* [1984, eng] B-30904

PHYSIOLOGY

Energy costs of growth, maintenance and reproduction of the female minke whale [1981, eng] B-29754

Protein electrophoresis in antarctic whales, Part 3 [1981, rus] B-30654

Bioaccumulation of DDTs and PCBs in the southern minke whale *(Balaenoptera acutorostrata)* [1984, eng] B-30904

On the functional activity of the sexual system of sperm whale males [1981, eng] B-31259

Mammalia-Cetacea

Management of marine mammals [1981, eng] B-29677
Antarctic arguments and options [1981, eng] B-29682
Growth and energy budgets of large baleen whales from the Southern Hemisphere [1981, eng] B-29684
Antarctic marine ecosystem: its conservation and exploitation [1983, ger] B-29700
Convention on the Conservation of Antarctic Marine Living Resources in action [1983, rus] B-29709
Carbohydrates related to phytoplankton in Bransfield Strait [1984, eng] B-29715
Nutrient influx and seal population at White Island [1984, eng] B-29716
Some biological parameters of antarctic fin whales [1981, eng] B-29762
Some biological parameters for the antarctic minke whale [1982, eng] B-29788
Conservation of antarctic marine living resources [1983, eng] B-29797
Comparison of marine soft-bottom communities in California and Antarctica [1980, eng] B-29807
Distribution of hydrocarbons in the antarctic environment [1980, eng] B-29832
Biology of Paraliparis of the South Shetlands [1981, eng] B-29834
Stock estimates for sperm whales using a length-specific technique [1983, eng] B-29893
Trophic interactions and community ecology of the shallow-water marine benthos along the Antarctic Peninsula [1980, eng] B-29896
Amphipods of waters around subantarctic islands [1983, eng] B-29921
Amphipod from subantarctic waters south of Australia and New Zealand [1983, eng] B-29922
Taxonomy and morphology of a Ross Sea crustacean [1983, eng] B-29923
Physical mechanism for establishing algal populations in frazil ice [1983, eng] B-29968
International protection of the living resources of the Antarctic [1981, pol] B-29981
Research at the Marine Fisheries Institute in Antarctica [1981, pol] B-29982
Marine nematodes of the superfamily Draconematoidea Filipjev [1978, eng] B-30028
Krill stock research in the BIOMASS program [1982, pol] B-30075
Nutrient cycles and food chains in the Antarctic [1984, eng] B-30096
Chlorophyll a distribution in the Indian Ocean [1984, eng] B-30126
Species size distributions in marine benthic communities [1984, eng] B-30131
SCAR bulletin No.77, May 1984 [1984, eng] B-30190
Origin, age, and evolution of antarctic and deep-sea faunas [1982, eng] B-30202
Examination of south polar organisms and their environments [1983, ger] B-30259
Nitrogen distribution in marine environment by phytoplankton and bacteria [1982, eng] B-30308
Radiolarian stratigraphy of the Indian Ocean and antarctic waters [1981, eng] B-30349
Antarctica: a convergence of life [1983, eng] B-30421
Food chain of antarctic marine living resources [1984, eng] B-30443
Comparative study of invertebrate supercooling at Signy Island [1984, eng] B-30463
Biomass and caloric studies on marine invertebrates and algae at Kerguelen, southern Indian Ocean [1983, eng] B-30542
BIOMASS newsletter, Vol.6, No.1, July 1981 [1984, eng] B-30573
Radionuclides in plankton from the South Pacific basin [1984, eng] B-30600
Southern ocean biological resources [1984, eng] B-30650
Bioassay demonstration that the effect of trace elements on the growth of antarctic phytoplankton is negligible [1984, fre] B-30663
Lipid biochemistry of antarctic midwater organisms [1983, eng] B-30679
Abstracts of papers on algae [1984, eng] B-30720
Littoral and benthic fauna of King George Island [1984, ger] B-30748
Diver in the south polar sea [1984, ger] B-30826
Biogeography of the Antarctic Peninsula and its adjacent archipelagos and seas [1984, spa] B-30886

Proceedings of the Sixth Symposium on Polar Biology [1984, eng] B-30888
Rearing of antarctic marine organisms in Japan [1984, eng] B-30898
Biological services and collections [1983, eng] B-30964
Antarctic ecology [1984, eng] B-30975
Antarctic marine flora [1984, eng] B-30982
Marine benthos [1984, eng] B-30983
Survey of antarctic zooplankton [1984, eng] B-30984
Fish biology [1984, eng] B-30985
Procellariforms and penguins of Antarctica [1984, eng] B-30986
Review of antarctic seals [1984, eng] B-30987
Review of antarctic cetaceans [1984, eng] B-30988
Interactions between antarctic marine ecosystems [1984, eng] B-30989
Life in cold water: The physiological ecology of polar marine ectotherms [1983, eng] B-31008
BIOMASS executive. Report of the second 1984 meeting, Bremerhaven, F.R.G., 2-3 October 1984 [1984, eng] B-31016
Bacterial plasmids in antarctic natural microbial assemblages [1984, eng] B-31054
BIOMASS newsletter, Vol.6, No.2, Dec. 1984 [1984, eng] B-31064
Manual for the measurement of total daily primary productivity [1983, eng] B-31067
Pelagic ecosystems of the southern ocean [1985, rus] B-31080
Meeting of BIOMASS Working Party on Bird Ecology [1984, eng] B-31086
Paleo-biogeographic analysis of Tertiary fish fauna from New Zealand and southern Australia [1981, eng] B-31134
Bajocian bivalves from Ellsworth Land, Antarctica [1983, eng] B-31140
Protozoan plankton characteristics in southwestern Pacific [1983, eng] B-31144
Development and growth in krill larvae [1984, eng] B-31207
Workshop on the biology and oceanography of antarctic krill distribution [1984, eng] B-31215
Elasmosaurus (Reptilia, Plesiosauria) of the Upper Cretaceous in the Antarctic [1984, eng] B-31233
BIOMASS Executive report of 1984 meeting, Cambridge, UK, 20-22 June, 1984 [1984, eng] B-31260
Report of Acoustic Working Party meeting to prepare for Post-FIBEX Acoustic Workshop, 1984 [1984, eng] B-31261
Sampling procedure for the earplugs provided to the Minke Whale Ageing Workshop [1984, eng] B-31282
Readability of antarctic minke whale earplugs [1984, eng] B-31283
Age-length relationships in whales [1984, eng] B-31284
Antarctic animal world [1984, ger] B-31303
Zoogeographic partition of the southern Pacific surface waters by macroplankton [1982, rus] B-31317
Euphausiid larvae in plankton samples [1985, eng] B-31327
Geographic distribution of macrozooplankton: Bransfield Strait and Scotia Sea [1985, eng] B-31328
Antarctic ecosystem: nature, impact and conservation [1984, spa] B-31357
Description of and key to an antarctic hydromedusa [1984, eng] B-31445
Environment and adaptation of krill in the Lazarev Sea [1985, rus] B-31665
Krill food supply and phytophaga in Scotia Sea [1985, rus] B-31666
Water masses, bottom topography and krill distribution [1984, eng] B-31697
Photoperiodic control of tetrasporangium formation in the red alga *Rhodochorton purpureum* [1983, eng] B-31703
Sinking rates of subantarctic neritic phytoplankton [1984, fre] B-31704
Benthic marine algal flora of Antarctica with special reference to *Himantothallus, Ascoseira,* and the Ceramiaceae [1984, eng] B-31722
Working Party on Fish Ecology. Report of the fourth meeting. Dammarieles-Lys, France, Aug. 25-29, 1984 [1985, eng] B-31734
Plankton in the ice of the Ross Sea [1985, eng] B-31735
Marine biology and stress effects in polar regions [1983, eng] B-31744
On the biology of polar seas, particularly the southern ocean [1983, eng] B-31745
Sea ice algal communities in the Weddell Sea [1983, eng] B-31747
Comparison of respiration in marine worms [1983, eng] B-31752
Genetic variations in Kerguelen benthic invertebrates [1983, eng] B-31753
Microfossil evidence for the age and environment of deposition of sediments of Heard and McDonald Islands [1983, eng] E-29637
Recent zoogeography of antarctic plankton microfossils [1979, eng] E-29793
Diatoms from the Sirius Formation, Transantarctic Mountains [1983, eng] E-30396
No evidence of mass faunal extinction in microtektite horizons (Upper Eocene) [1983, eng] E-30411
Miocene equatorial and southwest Pacific paleoceanography from stable isotope evidence [1983, eng] E-30416
Distribution of arenaceous foraminifera in Kerguelen Plateau area [1984, eng] E-31150
Toward a Quaternary time scale [1980, eng] E-31330
Planktonic foraminifera from submarine cores in southwestern Atlantic (ELTANIN, cruise 22) [1982, spa] E-31394
Geological significance of marine biogenic sedimentary structures [1982, eng] E-31410
Carboniferous and early Permian biogeography [1985, eng] E-31428
Pholadid borings in glaciomarine sediments of King George Island [1982, eng] E-31488
Ocean [1983, eng] F-29876
Quaternary paleoclimatology. Methods of paleoclimatic reconstruction [1985, eng] F-31647
Ocean for man [1983, rus] J-29058
Antarctic marine ecosystems [1983, jpn] J-29337
Late summer nutrients in the Indian sector of the southern ocean [1983, fre] J-29798
Biogenic silica accumulation on the antarctic continental shelf [1983, eng] J-30515
Results of Soviet research in the southern ocean [1984, eng] J-30637
Ecological system of antarctica [1983, jpn] J-31637
Dissolution and water mass patterns, SE Indian Ocean [1985, eng] J-31642
Dissolution and water mass patterns, SE Indian Ocean [1985, eng] J-31643
Convention on the Conservation of Marine Living Resources [1983, eng] M-29178
Protection of the antarctic ecosystem: a study in international environmental law [1983, eng] M-29179
Marine pollution and the exploitation of Antarctica [1982, eng] M-30048
Emerging Convention on the conservation of antarctic marine living resources: an attempt to meet the new realities of resource exploitation in the southern ocean [1982, eng] M-30053
Discourse on the CCAMLR [1984, eng] M-30444
Chile's antarctic policy [1984, spa] M-31344
Multilateral cooperation in antarctic marine ecosystem research [1982, eng] M-31676

Navigation
Position fixing in Antarctica [1983, eng] C-29436
Deep Freeze 1984 Cruise Report [1984, eng] G-30140
Antarctic infrastructure and policy of access to the continent [1984, spa] G-31356
Bathymetry and geomorphology of the coast of Queen Maud Land [1983, eng] J-29451

AIR
Historic FACH flight to the South Pole [1985, spa] A-31423
Aerial measurements of glaciological and geophysical parameters in Antarctica [1984, ger] G-31167
Dakotas in the Antarctic; a study in versatility [1971, eng] G-31438
Geopolitics of transpolar flights [1982, spa] G-31484
First direct flight Antarctica-Buenos Aires was made by the Argentine navy [1982, spa] G-31487
Runway at Rodolfo Marsh Martin Station [1983, eng] G-31533
Feasibility of long duration ballooning in Antarctica [1984, eng] I-31100
Aeromagnetic survey of Alexander Island [1983, eng] L-31048

SEA
Vessel remains at South Georgia [1984, eng] A-31122
D/E *Gizhiga* operations off Hobbs Coast and organization of the new antarctic station Russkaya [1984, rus] F-30863
Antarctic ice berths [1984, rus] F-30867
Sea ice of the southern ocean and navigation conditions [1984, rus] F-31706
Using drift snow for sea pier construction in Antarctica [1983, rus] G-29731
Experience of Polish ocean lines in the service of antarctic expeditions [1981, pol] G-29983
Antarctic navigation [1983, rus] G-30269
Activities of the 28th Soviet Antarctic Expedition [1983, eng] G-30590
Estimating ship position among icebergs [1984, rus] G-30854

Nuclear power
See: Power/Nuclear

Nuclei
See: Aerosols

Nutrition
Human adaptation to conditions in Antarctica [1983, rus] H-29240
Relationship between heavy exertion and scurvy [1983, eng] H-29322
Summary of French medical and psychological research [1983, fre] H-30885

See also under: Arthropoda-Arachnida; Arthropoda-Crustacea; Aves; Aves-Charadriiformes; Aves-Procellariiformes; Aves-Sphenisciformes; Coelenterata; Echinodermata; Mammalia; Mammalia-Pinnipedia; Pisces; Protozoa; Thallophyta-Algae. *See also:* Food supply

Observers
U.S. observer team visits foreign research stations [1983, eng] A-30960
Deep down south [1984, eng] A-31153
Report of the United States Antarctic inspection [1983, eng] M-29492

Ocean
Pelagic ecosystems of the southern ocean [1985, rus] B-31080
Antarctic silver fish distribution, habitat and biology [1984, rus] B-31082
Role of Antarctica in the formation of deep-sea fauna of the world ocean [1982, eng] B-31142
Phytoplankton drift transport and distribution in the vicinity of South Georgia Island [1984, eng] B-31511
Carbon dioxide excursions and the deep-sea record: aspects of the problem [1977, eng] E-31433
Rate of sedimentation in deep water [1969, eng] E-31439
Interaction of ocean swell with sea ice [1984, eng] F-29471
Monthly mean wind stress over the global ocean [1983, eng] I-29005
Soviet meteorological investigations in Antarctica [1983, rus] I-29187
Climate: ocean and atmosphere interaction in the Southern Hemisphere [1984, eng] I-30069
Influence of the southern oscillation on atmospheric carbon dioxide [1977, eng] I-31430
Comparison of sea surface wind speed fields by SEASAT radar altimeter, scatterometer, and scanning multichannel microwave radiometer, with an emphasis on the southern ocean [1984, eng] I-31502
Polish 2nd Antarctic Expedition oceanographic study of Ezcurra Inlet [1980, eng] J-29283
Current status and problems of southern ocean studies [1983, rus] J-29650
Present state of Soviet research on the Arctic and Antarctic oceans [1978, eng] J-30055
Hydrology of water close to Gough Island [1982, eng] J-30169
Evolution of cyclonic rings in the Antarctic [1984, rus] J-30182
Ocean temperature, salinity and turbidity [1983, jpn] J-30192
Paleoceanography: the history of the ocean's changing environments [1982, eng] J-30201
Results of Soviet research in the southern ocean [1984, eng] J-30637
Soviet-American investigations in the southern ocean [1979, rus] J-31079
Delta C-13 variations in marine carbonate sediments as indicators of the CO2 balance between the atmosphere and oceans [1977, eng] J-31431
Antarctic circumpolar ocean [1984, eng] J-31435
Some structural features of the Antarctic Ocean and Antarctica according to gravity data [1974, eng] L-31442
See also: Sea water

CIRCULATION
Seasonal plankton succession in coastal waters of the Antarctic Peninsula [1982, rus] B-28976
Large-scale circulation of antarctic waters and drift of krill [1984, eng] B-29942
Mixed waters of the secondary front zone of Scotia Sea and krill distribution [1984, eng] B-29943
Variation in marine conditions and patterns of krill distribution off western Antarctic Peninsula [1984, eng] B-29945
Biogeography of lanternfishes (Myctophidae) south of 30 S [1982, eng] B-30786
On the biology of polar seas, particularly the southern ocean [1983, eng] B-31745
Australian-Antarctic sector of the southern ocean [1982, eng] E-29865
Miocene equatorial and southwest Pacific paleoceanography from stable isotope evidence [1983, eng] E-30416
Carbonate cycles in Aptian-Albian "Black Shales" of the Falkland Plateau [1983, eng] E-30525
Model of interactions between ice stream, ocean and solid ground in West Antarctica [1983, eng] F-30437

Ocean
CIRCULATION *(cont.)*
Katabatic wind forcing of the Terra Nova Bay polynya [1984, eng] **I-30382**
Physical features of the southwestern Atlantic [1981, spa] **J-29036**
Water masses in the southwestern Atlantic [1981, spa] **J-29037**
Monitoring ACC transport in Drake Passage [1983, eng] **J-29209**
Disconformities and paleoceanography in the southeast Indian Ocean during the past 5.4 million years [1983, eng] **J-29313**
Scientific results of antarctic ocean survey (Physical oceanography) [1983, jpn] **J-29338**
Nonlinear model of mesoscale ocean circulation [1983, rus] **J-29503**
Tidal currents in the Pacific Basin and Campbell Plateau regions [1983, eng] **J-29512**
Meso-scale variability of the Antarctic Circumpolar Current from drifting buoy data [1983, rus] **J-29734**
Miocene stable isotope stratigraphy and paleoceanography [1981, eng] **J-29963**
Quasi-stationary cyclonic eddy in the Antarctic Circumpolar Current south of Africa [1984, rus] **J-30108**
C-13 record of benthic foraminifera [1984, eng] **J-30267**
New paleoecological evidence in the Indian Ocean for interhemispheric timing of climatic change [1984, eng] **J-30268**
Carbonate sedimentation beneath the Antarctic Circumpolar Current [1983, eng] **J-30520**
Weddell polynya as a consequence of hydrophysical processes in the Weddell circulation [1984, rus] **J-30552**
Water masses and circulation in the region of Prydz Bay, Antarctica [1984, eng] **J-30861**
Study of water mass transport in the Antarctic Circumpolar Current with the aid of tritium [1983, eng] **J-30887**
Marine environment [1984, eng] **J-30981**
Hydrological structure and energetics in mesoscale ocean vortexes [1984, rus] **J-31081**
Statistical estimates of the Antarctic Circumpolar Current in the Pacific Ocean [1983, eng] **J-31143**
Diagnostic calculations of water circulation in the Australian-New Zealand sector of the southern ocean [1983, eng] **J-31146**
Hydrochemical investigations in the Lazarev Sea [1984, eng] **J-31147**
Iceberg drift defines antarctic ocean circulation [1984, eng] **J-31231**
Modulation of marine sedimentation by the continental shelves [1977, eng] **J-31434**
Surface circulation from drifting buoy data [1985, eng] **J-31644**
Numerical model of the circulation and paleocirculation of the southern ocean [1985, rus] **J-31663**
Global ocean circulation patterns based on Seasat altimeter data and the GEML2 gravity field [1984, eng] **J-31719**
Peculiarities of circulation of the antarctic atmosphere and waters of the southern ocean [1984, eng] **K-30638**
CURRENTS
Spring meeting 1983, abstracts [1983, eng] **A-30203**
Conditions for krill clusters in the Lazarev Sea [1983, rus] **B-29088**
Krill in the Scotia Sea [1983, rus] **B-29091**
Geographical aspects of the life history of *Euphausia superba* [1983, eng] **B-29343**
Large-scale circulation of antarctic waters and drift of krill [1984, eng] **B-29942**
Variation in marine conditions and patterns of krill distribution off western Antarctic Peninsula [1984, eng] **B-29945**
Study of antarctic infusoria [1984, rus] **B-30106**
Biocenological aspects of exploiting krill [1984, eng] **B-30739**
Paleo-biogeographic analysis of Tertiary fish fauna from New Zealand and southern Australia [1981, eng] **B-31134**
Some features of the lateral distribution of antarctic krill aggregations [1982, eng] **B-31141**
Water movements and antarctic krill [1984, eng] **B-31193**
Distribution and seasonal peculiarities of plankton in the Amundsen Sea [1985, rus] **B-31664**
Deep-sea drilling in the roaring 40's [1973, eng] **E-29903**
History of the Ordovician continental platform shelf margin of Australia [1978, eng] **E-31019**
Satellites map the oceans [1983, eng] **F-30181**
Where do antarctic icebergs drift [1978, nor] **F-30733**
Variability of atmospheric circulation at the surface of the South Pacific Ocean in summer [1984, eng] **I-31104**
Modeling the oceanic environment of West Antarctica [1984, eng] **I-31112**
Si/P ratio as indicator of mixing zone [1982, rus] **J-28975**
Bathymetry of the North Victoria Land continental margin [1983, eng] **J-28994**

Water masses in the southwestern Atlantic [1981, spa] **J-29037**
Ocean for man [1983, rus] **J-29058**
Investigation of origin of krill found off South Georgia [1983, rus] **J-29090**
Hydrology of Bransfield Strait and krill distribution [1983, rus] **J-29092**
Effect of vortices on primary productivity [1983, ukr] **J-29203**
Monitoring ACC transport in Drake Passage [1983, eng] **J-29209**
Numerical simulations of the Ross Sea tides [1984, eng] **J-29228**
Antarctic marine ecosystems [1983, jpn] **J-29337**
Scientific results of antarctic ocean survey (Physical oceanography) [1983, jpn] **J-29338**
Nonlinear model of mesoscale ocean circulation [1983, rus] **J-29503**
Tidal currents in the Pacific Basin and Campbell Plateau regions [1983, eng] **J-29512**
Erosion in the southeast Indian and southwest Pacific Oceans [1983, eng] **J-29589**
Bottom-current erosion in the South Atlantic sector of the southern ocean [1983, eng] **J-29592**
Meso-scale variability of the Antarctic Circumpolar Current from drifting buoy data [1983, rus] **J-29734**
Late summer nutrients in the Indian sector of the southern ocean [1983, fre] **J-29798**
Some large scale aspects of the southern ocean and its environment [1980, eng] **J-29808**
Oceanographic data of the 23rd Japanese Antarctic Research Expedition from November 1981 to April 1982 [1984, eng] **J-30033**
Numerical modeling of baroclinic world ocean [1978, eng] **J-30083**
C-13 record of benthic foraminifera [1984, eng] **J-30267**
Vertical structure of the low-frequency currents at Drake Passage [1982, eng] **J-30307**
Temporal variability of the Antarctic Circumpolar Current [1984, eng] **J-30467**
Terrigenous deposits on the Maurice Ewing Bank [1984, eng] **J-30471**
Ross Sea heat flux experiment field activities [1983, eng] **J-30516**
Weddell polynya as a consequence of hydrophysical processes in the Weddell circulation [1984, rus] **J-30552**
Physical oceanography of the eastern Scotia Sea [1984, eng] **J-30596**
Southern Ocean [1978, eng] **J-30666**
Stratification and water masses at Drake Passage [1984, eng] **J-30816**
Current, temperature and salinity beneath George VI Ice Shelf [1984, eng] **J-30860**
Study of water mass transport in the Antarctic Circumpolar Current with the aid of tritium [1983, eng] **J-30887**
Marine environment [1984, eng] **J-30981**
Hydrological structure and energetics in mesoscale ocean vortexes [1984, rus] **J-31081**
Observations of current rings in the antarctic zone at Drake Passage [1984, eng] **J-31085**
Fluctuations of the subtropical and antarctic convergence zones [1985, eng] **J-31093**
Oceanographic data collected aboard R/V *Melville* during Jan.-Feb. 1979 and AGS *Yelcho* during Apr.-May 1979 as a part of DRAKE 79 [1979, eng] **J-31101**
Potential effect of CO2 warming on sub-ice-shelf circulation and basal melting [1984, eng] **J-31113**
Statistical estimates of the Antarctic Circumpolar Current in the Pacific Ocean [1983, eng] **J-31143**
Diagnostic calculations of water circulation in the Australian-New Zealand sector of the southern ocean [1983, eng] **J-31146**
Voyages of discovery and research in the southern and antarctic regions during the years 1964-1981 [1981, eng] **J-31148**

Iceberg drift defines antarctic ocean circulation [1984, eng] J-31231
Energetic eddies at the northern edge of the Antarctic Circumpolar Current in the Southwest Pacific [1985, eng] J-31310
Refraction of wave packets by currents [1982, eng] J-31443
Southern ocean thermal fronts south of Africa [1984, eng] J-31449
Hydrological structure of the immediate surroundings of Reunion Island during winter (Aug.-Sept. 1982) [1984, fre] J-31507
Eddy heat flux measurements in Drake Passage [1985, eng] J-31592
Surface circulation from drifting buoy data [1985, eng] J-31644
Applications of satellite altimetry to oceanography and geophysics [1984, eng] J-31718
Global ocean circulation patterns based on Seasat altimeter data and the GEML2 gravity field [1984, eng] J-31719
Antarctica—challenge for the 1990s [1984, eng] M-31098

EXPLOITATION
Ocean for man [1983, rus] J-29058
Oil pollution in the Antarctic [1983, eng] J-31557

TEMPERATURE
Seasonal plankton succession in coastal waters of the Antarctic Peninsula [1982, rus] B-28976
Distribution of sea birds and water masses in summer [1983, rus] B-29686
Nutrient depletion indicates high primary productivity in the Weddell Sea [1984, eng] B-30298
Diver in the south polar sea [1984, ger] B-30826
Paleoceanography of the southern ocean [1984, eng] B-30833
Ontogenetic adaptations in krill growth and respiration [1984, eng] B-31209
Miocene equatorial and southwest Pacific paleoceanography from stable isotope evidence [1983, eng] E-30416
Planktonic foraminifera from submarine cores in southwestern Atlantic (ELTANIN, cruise 22) [1982, spa] E-31394
Comments about the ocean role in the antarctic glacial ice balance [1983, eng] F-29974
Mass balance of a melting ice shelf [1984, eng] F-31172
Iceberg ablation in the d'Urville Sea [1984, eng] F-31174
Estimates of future sea level rise [1984, eng] F-31694
Variability of atmospheric circulation at the surface of the South Pacific Ocean in summer [1984, eng] I-31104
AGCM simulations of the modern antarctic climate [1984, eng] I-31111
Modeling the oceanic environment of West Antarctica [1984, eng] I-31112
Seasonal components of atmospheric CO2: information from new approaches to the decomposition of seasonal time series [1985, eng] I-31649
Distribution of krill clusters in the Pacific [1983, rus] J-29089
Investigation of origin of krill found off South Georgia [1983, rus] J-29090
Hydrology of Bransfield Strait and krill distribution [1983, rus] J-29092
Heat flow measurements in Lützow-Holm Bay, Antarctica [1983, eng] J-29113
Hydrographic data from the US-USSR Weddell Polynya Expedition [1983, eng] J-29212
Thermohaline stratification below the southern ocean sea ice [1984, eng] J-29230
Oceanographic observations during the 22nd Japanese Antarctic Research Expedition [1982, eng] J-29376
Some physical characteristics of the Antarctic and western Indian Oceans [1983, eng] J-29438
Heat flow measurements in Lützow-Holm Bay [1983, eng] J-29616
Two temperature sections through the South Atlantic and Weddell Sea [1982, eng] J-29663
Meridional heat transport in the Pacific Ocean [1984, eng] J-30091
Hydrology of water close to Gough Island [1982, eng] J-30169
Energetically active regions of the World Ocean [1984, rus] J-30183
C-13 record of benthic foraminifera [1984, eng] J-30267
New paleoecological evidence in the Indian Ocean for interhemispheric timing of climatic change [1984, eng] J-30268
Oceanographic data from the 24th JARE Nov 1982 to Apr 1983 [1984, eng] J-30511
Ross Sea heat flux experiment field activities [1983, eng] J-30516
Weddell Gyre [1983, eng] J-30517
Weddell polynya as a consequence of hydrophysical processes in the Weddell circulation [1984, rus] J-30552
World's coldest seawater [1978, nor] J-30730
Paleo-oceanography: global ocean evolution [1983, eng] J-30817
Thermal structure of upper ocean layers Capetown to SANAE, Summer 1978 [1983, eng] J-30834

Biogeography of lanternfishes (Myctophidae) south of 30 S [1982, eng] **B-30786**
Nonlinear model of mesoscale ocean circulation [1983, rus] **J-29503**
Some large-scale aspects of the southern ocean and its environment [1980, eng] **J-29808**
Isotopic tracers in polar seas and glacier ice [1984, eng] **J-30614**
Studies of ocean level fluctuations during postglacial time [1982, rus] **J-30742**
Antarctic and Greenland ice sheets and the level of world ocean [1982, rus] **J-30743**
Tectonic evolution of the Pacific Ocean since 74 Ma [1983, eng] **J-31131**
Statistical estimates of the Antarctic Circumpolar Current in the Pacific Ocean [1983, eng] **J-31143**
Diagnostic calculations of water circulation in the Australian-New Zealand sector of the southern ocean [1983, eng] **J-31146**
Delta C-13 variations in marine carbonate sediments as indicators of the CO2 balance between the atmosphere and oceans [1977, eng] **J-31431**
Modulation of marine sedimentation by the continental shelves [1977, eng] **J-31434**
Refraction of wave packets by currents [1982, eng] **J-31443**
Numerical model of the circulation and paleocirculation of the southern ocean [1985, rus] **J-31663**

Operations
See: Cargo operations; Logistics; Search and rescue; Transportation; Traverse operations

Optical phenomena
See under: Atmosphere

Optical properties
See under: Sea water

Outgoing radiation
See: Radiation/Atmospheric; Radiation/Terrestrial

Ozone
Stratospheric-tropospheric ozone exchange in Antarctica caused by mountain waves [1983, eng] **I-29100**
Surface ozone in the maritime atmosphere [1983, ger] **I-29171**
Average ozone profiles for 1979 from the NIMBUS 7 SBUV instrument [1984, eng] **I-30318**
Meteorological and aerosol experiments in Antarctica [1983, eng] **I-30703**
Air chemistry monitoring at Palmer Station [1983, eng] **I-30707**
Meteorological research projects in the Antarctic from 1959 to 1984 [1984, eng] **I-30801**
Model of stratospheric ozone distribution [1984, eng] **I-30859**

Pack ice
Distribution of nutrient salt and phytoplankton in the Antarctic Ocean [1982, eng] **B-29377**
Vertical distribution of chlorophyll *a* along 45 E [1982, eng] **B-29385**
Some observations of the biological productivity of antarctic waters [1983, eng] **B-29457**
Bottom-ice microalgal community of East Antarctica [1983, eng] **B-29497**
Minke whaling in the 34th antarctic whaling season, 1979/80 [1981, eng] **B-29758**
Sightings of minke whales in pack ice off Enderby Land coast [1982, eng] **B-29787**
Operating pattern of Japanese minke whaling in 1981/82 [1983, eng] **B-29889**
Relative abundance of diatoms in Weddell Sea pack ice [1983, eng] **B-30537**
Choanoflagellates in the antarctic ocean [1984, eng] **B-30889**
Seasonal change of chlorophyll *a* in Lützow-Holm Bay [1984, eng] **B-30893**
Paralabidocera antarctica occurrence and age composition at Showa Station [1984, eng] **B-30894**
Minke whaling by the Japanese in 1982-83 [1984, eng] **B-31277**
Pack ice edge data from Japanese catcher boats in the Antarctic [1984, eng] **B-31278**
Special colour enhancement for three channels having similar radiances [1984, eng] **C-31454**
Glaciological studies during the First Indian Antarctic Expedition [1983, eng] **F-29450**
Interaction of ocean swell with sea ice [1984, eng] **F-29471**
Physical conditions of fast ice formation in East Antarctica [1979, eng] **F-31059**
Polish 2nd Antarctic Expedition oceanographic study of Ezcurra Inlet [1980, eng] **J-29283**

Oceanographic observations during the 22nd Japanese Antarctic Research Expedition [1982, eng] **J-29376**
Carbonate chemistry of the Weddell Sea [1984, eng] **J-29975**
Oceanography of the antarctic marginal ice zone [1983, eng] **J-30541**

CORES
Morphology and ecology of diatoms in sea ice from the Weddell Sea [1984, eng] **B-30357**

CRYSTALS
Elemental compositions and concentrations of microspherules in snow and pack ice from the Weddell Sea [1983, eng] **F-30514**

DESTRUCTION
Bearing strength of fast ice and antarctic transport operations during the spring-summer period [1979, eng] **F-31060**

ELECTRICAL PROPERTIES
Distribution of electrical parameters in upper layers of shelf, land, and fast ice near Novolazarevskaya Station [1984, eng] **F-31733**

STRUCTURE
Bearing strength of fast ice and antarctic transport operations during the spring-summer period [1979, eng] **F-31060**

SURFACE FEATURES
Surface roughness of Ross Sea pack ice [1983, eng] **F-30410**

TEMPERATURE
Bearing strength of fast ice and antarctic transport operations during the spring-summer period [1979, eng] **F-31060**

THICKNESS
Ice dynamics [1984, eng] **F-30815**

Packaging
Development of mobile field units by British Antarctic Survey [1983, eng] **G-31559**

Paleobotany
Light and electron microscopy of diatom algae [1982, rus] **B-29854**
Southern high-latitude diatom biostratigraphy [1981, eng] **E-29172**
Spores, pollen, and microplankton from the South Shetlands [1983, eng] **E-29572**
Recycled palynomorphs in antarctic sediments [1983, eng] **E-29593**
Palaeoclimatic significance of some Mesozoic antarctic fossil floras [1983, eng] **E-29630**
Dinocyst biostratigraphy of Seymour Island [1982, eng] **E-29857**
Deep-sea drilling in the roaring 40's [1973, eng] **E-29903**
Jurassic trees engulfed by lavas of the Kirkpatrick Basalt Group [1983, eng] **E-30228**
Permian and Triassic woods from the Transantarctic Mountains [1983, eng] **E-30246**
Structurally preserved plants from the Beardmore Glacier area [1983, eng] **E-30247**
Campanian palynomorphs from Ross and Vega Islands, Antarctic Peninsula [1983, eng] **E-30251**
Fossil flora at Suffield Point, King George Island [1985, spa] **E-31414**
Plant remains from the Point Hennequin Group (Upper Oligocene), King George Island [1985, eng] **E-31458**
Paleontological research in Antarctica and contribution of Polish scientists [1983, pol] **E-31491**
Early glacial deposits in the Prince Charles Mountains [1985, rus] **E-31658**
Zoogeography and the continental drift theory [1980, ger] **E-31677**
Global temperature trend in the Cenozoic [1981, eng] **I-29148**

Paleoceanography

Paleoclimatology *(cont.)*
Stratigraphy and glacial-marine sediments of the Arctic and southern oceans [1980, eng] E-31331
Carboniferous and early Permian biogeography [1985, eng] E-31428
Benthic mixing in deep sea cores as determined by C-14 dating [1977, eng] E-31432
Carbon dioxide excursions and the deep-sea record: aspects of the problem [1977, eng] E-31433
Principal glacial events of the past and their geologic significance [1984, eng] E-31671
Data on past air composition from ice cores of Greenland and Byrd Station, Antarctica [1983, eng] F-29234
Vostok Station paleoclimate from isotopic core studies [1980, rus] F-29417
Evolution of McMurdo Sound mountain glaciers [1980, rus] F-29420
Periodization principles of antarctic glaciation history [1980, rus] F-29421
On late-glacial and holocene glacier fluctuations in maritime West Antarctica [1983, eng] F-29863
Ocean [1983, eng] F-29876
Antarctic ice: the frozen time capsule [1983, eng] F-29919
Evolutive spectral analysis by autoregressive process of isotopic climatic data from Antarctica [1983, eng] F-30356
Late Tertiary history of the antarctic ice sheet from Dry valleys evidence [1984, eng] F-30425
Symposium on Ice and Climate Modeling, 1983 [1984, eng] F-30478
Baseline acidity of ancient precipitation from the South Pole [1984, eng] F-30570
Paleoglaciology in Antarctica [1984, eng] F-30640
Microparticles in ice cores from Antarctica and Greenland [1984, chi] F-30831
Quaternary paleoclimatology. Methods of paleoclimatic reconstruction [1985, eng] F-31647
Atmospheric trace elements in antarctic prehistoric ice collected at a coastal ablation area [1984, eng] F-31721
Global temperature trend in the Cenozoic [1981, eng] I-29148
Reconstruction of the Quaternary ice cover on Marion Island [1983, eng] I-29606
Microanalysis of an East Antarctic ice core for paleoclimate reconstruction models [1983, eng] I-29726
Atmospheric carbon dioxide of the past [1980, fre] I-29813
High latitude climates of the Pacific [1983, eng] I-29831
Eleventh INQUA symposium on paleoclimatology and glacial history of the Southern Hemisphere [1983, rus] I-29934
Climate and ice sheets [1982, eng] I-30020
Glaciers and climate [1984, rus] I-30032
30000 yr. climatic record. Main results deduced from oxygen 18 and deuterium profiles from the Dome C ice core (Antarctica) [1981, eng] I-30085
Climatic changes in both hemispheres and bipolar interglacial warming [1984, eng] I-30287
Late-glacial maximum-Holocene atmospheric and ice-thickness changes from Antarctic ice-core studies [1984, eng] I-30481
Soluble and insoluble impurities in Vostok ice core and climatic implications [1984, eng] I-30933
Hemispheric circulation asymmetry during Late Tertiary [1981, eng] I-31138
Milankovitch and climate [1982, eng] I-31293
Two-dimensional climate model useful in ice age application [1982, eng] I-31295
Terminations [1982, eng] I-31296
Insolation gradients and the paleoclimatic record [1982, eng] I-31297
Sensitivity experiment to astronomical forcing with a spectral GCM: simulation of the annual cycle at 120,000 BP and 115,000 BP [1982, eng] I-31298
Response of a climate model to orbital variations [1982, eng] I-31299
Influence of the CLIMAP ice sheet on the climate of a general circulation model: implications for the Milankovitch theory [1982, eng] I-31300
Major climatic events associated with a prolonged CO2-induced warming [1981, eng] I-31441
Paleoclimatic research and models [1983, eng] I-31739
Actual paleoclimatic problems from a climatologist's viewpoint [1983, eng] I-31740
Disconformities and paleoceanography in the southeast Indian Ocean during the past 5.4 million years [1983, eng] J-29313
Miocene stable isotope stratigraphy and paleoceanography [1981, eng] J-29963
Paleoceanography: the history of the ocean's changing environments [1982, eng] J-30201
New paleoecological evidence in the Indian Ocean for interhemispheric timing of climatic change [1984, eng] J-30268
Delta C-13 variations in marine carbonate sediments as indicators of the CO2 balance between the atmosphere and oceans [1977, eng] J-31431
Dissolution and water mass patterns, SE Indian Ocean [1985, eng] J-31642
Dissolution and water mass patterns, SE Indian Ocean [1985, eng] J-31643
Numerical model of the circulation and paleocirculation of the southern ocean [1985, rus] J-31663

Paleomagnetism
Dry valleys/McMurdo Sound magnetostratigraphy and sedimentology [1983, eng] E-30235
Paleomagnetism of outcropping oceanic crust on Macquarie Island [1978, eng] E-31020
Stratigraphy, sedimentology, and paleomagnetism in Taylor Valley [1981, eng] E-31395
Paleomagnetic investigations in northern Victoria Land [1983, eng] L-29545
Geophysical evidence of antarctic crustal structure [1983, eng] L-29612
Paleomagnetism of volcanic rocks form Marie Byrd Land [1983, eng] L-29626
Cretaceous and early Tertiary paleomagnetic results from the Antarctic Peninsula [1984, eng] L-30271

Paleontology
Archaeological investigations in Antarctica [1983, spa] A-29303
National Science Foundation annual report 1983 [1983, eng] A-30095
Upper Jurassic fauna in the Antarctic Peninsula [1983, spa] B-29153
New Cretaceous asteroidea from Vicecomodoro Marambio Island [1983, spa] B-29154
Ranking of dissolution susceptibility of planktonic foraminifera [1983, eng] B-29289
Origin, age, and evolution of antarctic and deep-sea faunas [1982, eng] B-30202
Radiolarian stratigraphy of the Indian Ocean and antarctic waters [1981, eng] B-30349
Fossil and recent Bryozoa from the Ross Sea [1984, eng] B-30832
Ecology of the diatom *Eucampia antarctica* [1984, eng] B-31023
Paleo-biogeographic analysis of Tertiary fish fauna from New Zealand and southern Australia [1981, eng] B-31134
Bajocian bivalves from Ellsworth Land, Antarctica [1983, eng] B-31140
Revision of the Seguenziacea Verrill, 1884 (Gastropoda: Prosobranchia). 1. Summary and evaluation of the superfamily [1983, eng] B-31177
Fossil genus *Axopora* (Coelenterata: hydrozoa) and its evolutionary significance to the Stylasteridae [1983, eng] B-31178
Elasmosaurus (Reptilia, Plesiosauria) of the Upper Cretaceous in the Antarctic [1984, eng] B-31233
Bythocytheridae ostracodes and ontogeny of the Sclerochilini tribe [1982, rus] B-31313
Protozoan colonization of tephra on Deception Island [1985, eng] B-31581
New geophysical and geological data in the Weddell Sea [1983, eng] E-29120
Foraminifera from raised beach deposits, Lützow-Holm Bay [1983, eng] E-29127
Ameghino refuge geology, San Martin Land, Antarctic Peninsula [1983, spa] E-29134
Glacial marine sedimentation model from antarctic Quaternary deposits [1983, eng] E-29199
Ross Sea Oligocene-Miocene glacial record [1983, eng] E-29237
Mistaken antarctic origin of two projectile points [1983, spa] E-29302
Discovery of an ammonite on the Antarctic Peninsula [1984, eng] E-29394
Paleomagnetic study with sedimentary rocks from James Ross Island [1983, spa] E-29484

Sedimentology of Robertson Bay [1983, eng] **E-29537**
Age and correlation of the Cambrian-Ordovician Bowers Supergroup, northern Victoria Land [1983, eng] **E-29542**
Trace fossils of the Takrouna formation, Victoria Land [1983, eng] **E-29558**
Palaeontological and stratigraphical investigations in the Ellsworth Mountains [1983, eng] **E-29566**
Cretaceous inoceramid bivavles from Antarctica [1983, eng] **E-29573**
Late Jurassic ammonites from the Orville Coast, Antarctica [1983, eng] **E-29576**
New marsupial from Seymour Island, Antarctic Peninsula [1983, eng] **E-29577**
Recycled palynomorphs in antarctic sediments [1983, eng] **E-29593**
Labyrinthodont amphibians of the earliest Triassic from Antarctica, Tasmania and South Africa [1983, eng] **E-29629**
Microfossil evidence for the age and environment of deposition of sediments of Heard and McDonald Islands [1983, eng] **E-29637**
Cretaceous and Tertiary pollen and spores in marine sediments [1983, eng] **E-29724**
Recent zoogeography of antarctic plankton microfossils [1979, eng] **E-29793**
Structural relation of East and West Antarctica [1964, eng] **E-29818**
Radiolarian distribution in the southeastern Indian Ocean [1978, eng] **E-29847**
Development of planktonic biostratigraphy in the southern ocean during the Cenozoic [1978, eng] **E-29848**
Dinocyst biostratigraphy of Seymour Island [1982, eng] **E-29857**
Tectonics of some Paleozoic fossils of northern Victoria Land [1984, eng] **E-29916**
Preliminary geological results of the 1983-1984 Ohio Range expedition [1984, eng] **E-30149**
1980 annual meetings [1980, eng] **E-30197**
1982 annual meetings [1982, eng] **E-30198**
Pre-quaternary fossiliferous glacio-marine deposits at King George Island [1981, eng] **E-30207**
Geological investigations of portions of northern Victoria Land [1983, eng] **E-30224**
Brachiopods with Australian and New Zealand affinities in the Spurs Formation [1983, eng] **E-30230**
Gondwana rocks of the Allan Hills [1983, eng] **E-30232**
Dry valleys/McMurdo Sound magnetostratigraphy and sedimentology [1983, eng] **E-30235**
Revision of ages of Cenozoic erratics at Mount Discovery and Minna Bluff [1983, eng] **E-30238**
Large thecodont reptiles from the Fremouw Formation [1983, eng] **E-30245**
Ellsworth Mountains studies, 1982-1983 [1983, eng] **E-30250**
Changes in macrofossil faunas at the end of the Cretaceous on Seymour I. [1983, eng] **E-30254**
Upper Cretaceous to paleocene sedimentology and macropaleontology, Seymour I. [1983, eng] **E-30255**
Upper Cretaceous microfossil biostratigraphy of Seymour Island [1983, eng] **E-30256**
Expedition to Valdes: Miocene stratigraphy and recent silled basins [1983, eng] **E-30258**
Stratigraphy in Wright Valley: implications for Tertiary glacial history [1982, eng] **E-30373**

Specimen of rare fish caught in Prydz Bay [1981, eng] B-29837
Muraenolepidae eggs and larvae from the Scotia Sea [1983, eng] B-29879
Demographic characteristics of an antarctic plunderfish [1983, eng] B-29906
Taxonomy and morphometric and meristic analysis of *Sprattus fuegensis* [1982, spa] B-30143
Ice fish (Chaenichthyidae) in the South Atlantic [1982, ger] B-30155
Ecology of *Cyclothone microdon* in the southern part of the Pacific Ocean [1981, eng] B-30320
Fish distribution in Scotia Sea and off the Antarctic Peninsula [1983, eng] B-30339
Contribution to the fish fauna of Weddell Sea [1984, eng] B-30716
Biogeography of lanternfishes (Myctophidae) south of 30 S [1982, eng] B-30786
Fish biology [1984, eng] B-30985
Larvae of the family Nototheniidae from the Scotia Sea [1984, eng] B-31052
Paleo-biogeographic analysis of Tertiary fish fauna from New Zealand and southern Australia [1981, eng] B-31134
Postlarval notothenioids [1984, eng] B-31698

MIGRATION

Distribution and feeding of *Electrona carlsbergi* Tåning (Myctophidae) in the Scotia Sea [1981, rus] B-30322

MORPHOLOGY

New species and a new subspecies of *Paraliparis* (Liparidae) from western Antarctica, Pt.2 [1982, eng] B-29029
Biological study of fish in the Elephant Island area [1983, spa] B-29139
Aging of antarctic fishes [1982, eng] B-29183
Atlas of Fish Larvae of the Southern Ocean [1983, eng] B-29245
Technological characteristics and potential utilization of antarctic fish [1982, rus] B-29249
Biology of fish around Falkland Islands [1982, eng] B-29284
Bottom trawl fishing off South Shetland Islands [1982, eng] B-29383
Neuromuscular cold-adaptation in an antarctic fish [1983, eng] B-29389
Identification of fish from the southern ocean by means of otoliths [1984, eng] B-29399
Scopelosaurus hamiltoni (Notosudidae) in the Scotia Sea [1981, eng] B-29688
Proteins in the muscles of an antarctic fish [1980, eng] B-29823
Biology of Paraliparis of the South Shetlands [1981, eng] B-29834
Gametogenesis and fecundity in *Trematomus bernacchii* [1981, eng] B-29835
Specimen of rare fish caught in Prydz Bay [1981, eng] B-29837
Muraenolepidae eggs and larvae from the Scotia Sea [1983, eng] B-29879
Demographic characteristics of an antarctic plunderfish [1983, eng] B-29906
Morphometry of muscle fibers and capillaries of some antarctic fish [1982, eng] B-29908
New species of *Echiodon* in the Antarctic [1983, eng] B-29931
Biochemical adaptation [1984, eng] B-30039
Fine structure of endothelial cells of white-blooded fish *Chaenocephalus aceratus* [1983, eng] B-30111
Age and growth of *Sprattus fuegensis* off Falkland Islands [1982, spa] B-30142
Taxonomy and morphometric and meristic analysis of *Sprattus fuegensis* [1982, spa] B-30143
Ice fish (Chaenichthyidae) in the South Atlantic [1982, ger] B-30155
Age determination and growth of *Notothenia gibberifrons* Lönnberg at South Georgia [1982, ger] B-30156
Endothelial cells in teleosts and elasmobranchs [1984, eng] B-30300
Ecology of *Cyclothone microdon* in the southern part of the Pacific Ocean [1981, eng] B-30320
Reproduction of "limbless" sole (Bothidae) in southwestern Atlantic [1981, eng] B-30321
Age determination of *Notothenia rossii* from South Georgia [1984, eng] B-30587
Contribution to the fish fauna of Weddell Sea [1984, eng] B-30716
Age determination and growth of fish from McMurdo Sound [1984, eng] B-30824
Preliminary results of biological studies at Mirnyy Station in the winter 1979 [1984, rus] B-30852
Gill arches of fishes of the suborder Notothenioidei (Pisces, Perciformes) [1984, eng] B-30897
Larvae of the family Nototheniidae from the Scotia Sea [1984, eng] B-31052
Observations on gills of pelagic and demersal juvenile *Notothenia rossii* [1984, eng] B-31120
Feeding ecology of three Marion Island fish species [1982, eng] B-31425

NUTRITION

Energy metabolism and nutrition in marbled notothenia [1982, eng] B-29030
Food and habitat of *Notothenia rossii* [1983, eng] B-29066
Nitrogen assimilation and elimination in *Trematomus newnesi* [1983, spa] B-29138
Biological study of fish in the Elephant Island area [1983, spa] B-29139
Inshore fishes of Heard and McDonald Islands [1983, eng] B-29315
Stomach contents in fish from Lützow-Holm Bay [1982, eng] B-29384
Food of fish around the Antarctic Peninsula [1981, eng] B-29836
Ice fish (Chaenichthyidae) in the South Atlantic [1982, ger] B-30155
Distribution and feeding of *Electrona carlsbergi* Tåning (Myctophidae) in the Scotia Sea [1981, rus] B-30322
Food habits of *Nototheniidae* in Admiralty Bay, King George Island [1983, eng] B-30342
Whole body krill meal and non-muscle krill meal in fish diet [1984, eng] B-30371
Effects on fish growth of growth promoting fractions of non-muscle krill meal [1984, eng] B-30372
Food chain of antarctic marine living resources [1984, eng] B-30443
Astaxanthin content of silver salmon *(Oncorhynchus kisulch)* [1983, jpn] B-30551
Contribution to the fish fauna of Weddell Sea [1984, eng] B-30716
Parasite infestations and food of animals near Bellingshausen Station [1984, ger] B-30749
Pigmentation of cultured yellowtail with krill oil [1983, jpn] B-30774
Pigmentation of cultured red sea bream with astaxanthin diester purified from krill oil [1983, jpn] B-30776
Pigmentation of red sea bream using astaxanthin from krill and a mysid [1984, eng] B-31124
Effect of nutritional quality of diets on red sea brim reproduction [1984, eng] B-31183
Peroxismal oxidation of fatty acids in liver of rainbow trout *(Salmo gairdnerii)* fed diets of marine zooplankton [1982, eng] B-31187
Feeding ecology of three Marion Island fish species [1982, eng] B-31425

Effects of previous dietary history on the mortality and changes in body composition of chum salmon fry during starvation in seawater [1983, jpn] **B-31727**
PATHOLOGY
Biology of fish around Falkland Islands [1982, eng] **B-29284**
Concentration of heavy metals in antarctic fish *Pagothenia borchgrevinki* [1983, eng] **B-30178**
Contribution to the fish fauna of Weddell Sea [1984, eng] **B-30716**
Fate of DDTs, PCBs and chlordane compounds in the antarctic marine ecosystem [1984, eng] **B-30905**
Recovery from stress following capture and anaesthesia of antarctic fish: haematology and blood chemistry [1984, eng] **B-31084**
Ecologic aspects of protozoan infections in antarctic fishes [1984, eng] **B-31466**
Environmental pollution of chlorinated hydrocarbons around Showa Station [1983, jpn] **G-29406**
PHYSIOLOGY
Energy metabolism and nutrition in marbled notothenia [1982, eng] **B-29030**
Trematomus basal metabolism [1983, spa] **B-29137**
Nitrogen assimilation and elimination in *Trematomus newnesi* [1983, spa] **B-29138**
Aging of antarctic fishes [1982, eng] **B-29183**
Technological characteristics and potential utilization of antarctic fish [1982, rus] **B-29249**
Working party on fish biology [1980, eng] **B-29252**
Protein synthesis in nototheniids and icefish [1983, eng] **B-29327**
Antifreeze glycopeptides of antarctic fishes [1983, eng] **B-29328**
Neuromuscular cold-adaptation in an antarctic fish [1983, eng] **B-29389**
Biological antifreezes in *Harpagifer antarcticus* [1983, spa] **B-29483**
Metabolism in marbled notothenia [1981, eng] **B-29687**
Gametogenesis and fecundity in *Trematomus bernacchii* [1981, eng] **B-29835**
Biological antifreeze agents in coldwater fishes [1982, eng] **B-29959**
Biochemical adaptation [1984, eng] **B-30039**
DDTs and PCB isomers and congeners in antarctic fish [1983, eng] **B-30109**
Age and growth of *Sprattus fuegensis* off Falkland Islands [1982, spa] **B-30142**
Concentration of heavy metals in antarctic fish *Pagothenia borchgrevinki* [1983, eng] **B-30178**
Antifreeze peptides and glycopeptides in polar fishes [1983, eng] **B-30305**
Whole body krill meal and non-muscle krill meal in fish diet [1984, eng] **B-30371**
Effects on fish growth of growth promoting fractions of non-muscle krill meal [1984, eng] **B-30372**
Astaxanthin content of silver salmon *(Oncorhynchus kisulch)* [1983, jpn] **B-30551**
Age determination of *Notothenia rossii* from South Georgia [1984, eng] **B-30587**
Oxygen consumption of five species of fish from South Georgia [1984, eng] **B-30658**
Role of glycoprotein antifreezes in freezing avoidance of antarctic fish [1983, eng] **B-30680**
Comparative analysis of leucine transport in fish liver [1984, eng] **B-30718**
Pigmentation of cultured yellowtail with krill oil [1983, jpn] **B-30774**
Pigmentation of cultured red sea bream with astaxanthin diester purified from krill oil [1983, jpn] **B-30776**
Carotenoids in antarctic fish of different ages [1982, eng] **B-30820**
Age determination and growth of fish from McMurdo Sound [1984, eng] **B-30824**
Preliminary results of biological studies at Mirnyy Station in the winter 1979 [1984, rus] **B-30852**
Rearing of antarctic marine organisms in Japan [1984, eng] **B-30898**

Postal service
Postal history of Soviet antarctic activities 1955-1977 [1980, eng] A-30796

Power
CEC and Seabee's involvement in Antarctica [1983, eng] G-29281
Exploitation of geothermal energy in Antarctica [1984, spa] G-31245
Utilization of wind power for the Japanese automated stations [1983, eng] G-31554
Use of wind and solar energy as a power supply for satellite automatic weather sensing stations in Antarctica [1983, eng] G-31555
Power generation using natural sources [1983, eng] G-31556
ELECTRIC
Power plant installation manual for Australian antarctic stations [1981, eng] G-31341
Proposal for rebuilding Australian antarctic stations [1981, eng] G-31342
Manual for Australian antarctic utilities, bridges, and supports [1982, eng] G-31373
Proceedings of the 3rd Symposium on Antarctic Logistics, 1982 [1983, eng] G-31513
Rebuilding of Australia's 3 antarctic stations, Parts 1-3 [1983, eng] G-31539
Support of construction activities during rebuilding of Australia's antarctic stations [1983, eng] G-31540
New design concept for Halley Station [1983, eng] G-31543
Technical concepts of the antarctic stations Georg-Von-Neumayer and Filchner of the Federal Republic of Germany [1983, eng] G-31545
Scott Base rebuilding programme [1983, eng] G-31552
Energy supply for the Soviet antarctic stations [1983, eng] G-31553
NUCLEAR
History of the McMurdo nuclear power plant [1982, eng] G-29708

Precipitation
Snow storm with strong wind in Antarctica [1983, jpn] F-29962
Past precipitation rates derived from ice core measurements [1984, eng] F-30023
Quantitative analysis of snow-line zonality [1984, chi] F-31139
Quaternary paleoclimatology. Methods of paleoclimatic reconstruction [1985, eng] F-31647
Use of snow airfields in Antarctica for determination of accumulation rate and atmospheric precipitation [1985, rus] F-31660
Climate monitoring in Antarctica [1983, rus] I-29648
Model of the antarctic sink for stratospheric water vapor [1980, eng] I-29805
Circulation contrasts in the southern hemisphere winters of 1972 and 1973 [1983, eng] I-29830
Weather and climate of the Antarctic [1984, eng] I-30185
Chemistry of precipitation in relation to precipitation type [1982, eng] I-30429
Deuterium as related to water vapor and precipitation at Schirmacher Ponds [1984, eng] I-30452
Particle concentrations at the South Pole, on meteorological and climatological time scale [1984, eng] I-30505
On the interaction of aerosol with meteorology [1984, eng] I-30672
Air-sea interactions over the Ross Sea in the surface boundary layer [1983, eng] I-30700
Inorganic substance content in atmospheric precipitation at Mirnyy Station [1984, rus] I-30872
AGCM simulations of the modern antarctic climate [1984, eng] I-31111
Radar measurements of atmospheric precipitation in Antarctica [1984, rus] I-31641

Pressure
See under: Atmosphere; Upper air

Primary productivity
Biological characteristics of the southwestern Atlantic [1981, spa] B-29038
Phytoplankton development in the Indian Ocean [1983, rus] B-29084
Particulate matter and nutritional processes of krill [1983, eng] B-29347
Primary production in East Ongul Island mosses [1983, jpn] B-29407
Biological studies on the ice shelf and in freshwater lakes of Queen Maud Land [1983, eng] B-29456
Some observations of the biological productivity of antarctic waters [1983, eng] B-29457
Role of algal mats in the formation of stromatolites in dry valley lakes [1982, eng] B-29463
Bottom-ice microalgal community of East Antarctica [1983, eng] B-29497
Phytoplankton photosynthesis in ice covered lakes [1983, eng] B-29498
Krill—untapped bounty from the sea [1984, eng] B-29661
Antarctic marine ecosystem: its conservation and exploitation [1983, ger] B-29700
Trophogenic-layer stability as indicator of spatial heterogeneity in the Pacific [1984, eng] B-29944
Lake sediment chlorophyll *a* and adenosine triphosphate levels [1983, eng] B-29978

Primary productivity ***(cont.)***
- Nutrient cycles and food chains in the Antarctic [1984, eng] **B-30096**
- Moss photosynthesis and primary production at Showa Station [1983, eng] **B-30179**
- Nutrient depletion indicates high primary productivity in the Weddell Sea [1984, eng] **B-30298**
- Nitrogen distribution in marine environment by phytoplankton and bacteria [1982, eng] **B-30308**
- Dark fixation of CO2 in the subtropical North Pacific Ocean and the Weddell Sea [1983, eng] **B-30355**
- Antarctica: a convergence of life [1983, eng] **B-30421**
- Food chain of antarctic marine living resources [1984, eng] **B-30443**
- Antarctic plankton and the marine geochemistry of radium-226, barium, and germanium [1983, eng] **B-30534**
- Influence of light on development and growth of sea-ice microbial communities in McMurdo Sound [1983, eng] **B-30535**
- Phytoplankton studies in the sector between Africa and Antarctica [1983, eng] **B-30540**
- Distribution, abundance, and diversity of McMurdo Sound ice bacteria in 1980 [1984, eng] **B-30554**
- Southern ocean biological resources [1984, eng] **B-30650**
- Bioassay demonstration that the effect of trace elements on the growth of antarctic phytoplankton is negligible [1984, fre] **B-30663**
- Survey of antarctic zooplankton [1984, eng] **B-30984**
- Fish biology [1984, eng] **B-30985**
- Interactions between antarctic marine ecosystems [1984, eng] **B-30989**
- Manual for the measurement of total daily primary productivity [1983, eng] **B-31067**
- Pelagic ecosystems of the southern ocean [1985, rus] **B-31080**
- Protozoan plankton characteristics in southwestern Pacific [1983, eng] **B-31144**
- Feeding requirements of krill in relation to food sources [1984, eng] **B-31202**
- Biomass and production of antarctic krill *(Euphausia superba* Dana) [1983, eng] **B-31333**
- Utilization of phytoplankton by antarctic copepods [1983, eng] **B-31746**
- Si/P ratio as indicator of mixing zone [1982, rus] **J-28975**
- Effect of vortices on primary productivity [1983, ukr] **J-29203**
- Polish 2nd Antarctic Expedition oceanographic study of Ezcurra Inlet [1980, eng] **J-29283**
- Antarctic marine ecosystems [1983, jpn] **J-29337**
- Oceanography of the antarctic marginal ice zone [1983, eng] **J-30541**
- Southern Ocean [1978, eng] **J-30666**

Procellariiformes
- *See:* Aves-Procellariiformes

Programs
- *See:* Research programs

Protozoa
- Vertical distribution of agglutinating Foraminifera [1982, rus] **B-28978**
- Benthic protozoa from marine antarctic freshwater lakes and pools [1984, eng] **B-29398**
- Protozoan colonization of artificial substrates in two antarctic lakes [1982, eng] **B-29977**
- Radionuclides in plankton from the South Pacific basin [1984, eng] **B-30600**
- Microflora-microfauna interactions in moss peat decomposition [1983, eng] **B-31066**
- *Hemichloris antarctica*, gen. et sp. nov. (Chlorococcales, Chlorophyta), a cryptoendolithic alga from antarctica [1984, eng] **B-31366**
- Ecologic aspects of protozoan infections in antarctic fishes [1984, eng] **B-31466**
- Protozoan colonization of tephra on Deception Island [1985, eng] **B-31581**
- Ross Sea Oligocene-Miocene glacial record [1983, eng] **E-29237**
- Miocene equatorial and southwest Pacific paleoceanography from stable isotope evidence [1983, eng] **E-30416**
- Paleogene oxygen isotope records for the subantarctic South Atlantic Ocean: DSDP sites 511 and 512 [1983, eng] **E-30522**
- Age of folded rocks of Pensacola Mountains (West Antarctica) [1984, rus] **E-30864**
- Atlantic Cenozoic silicoflagellates, potential for biostratigraphic and paleoecologic studies [1977, eng] **E-31309**
- Planktonic foraminifera from submarine cores in southwestern Atlantic (ELTANIN, cruise 22) [1982, spa] **E-31394**
- C-13 record of benthic foraminifera [1984, eng] **J-30267**
- New paleoecological evidence in the Indian Ocean for interhemispheric timing of climatic change [1984, eng] **J-30268**

BEHAVIOR
- Mass occurrence of protozoans in antarctic sediments [1983, eng] **B-31383**

ECOLOGY
- Soil testate rhizopods of South Georgia [1983, eng] **B-29204**
- Endolithic microorganisms in extreme dry environments: analysis of a lithobiontic microbial habitat [1984, eng] **B-31365**
- Diachronous niche expansion and morphological adaptation by *Globorotalia truncatulinoides* in Late Quaternary sediments [1983, eng] **E-30523**
- Eocene-Oligocene calcareous nannofossil assemblages from piston cores taken in the vicinity of deep sea drilling sites 511 and 512, Falkland Plateau [1983, eng] **E-30526**
- Occurrence of *Pseudammodochium* from the subbottom sediments of the Ross Ice Shelf [1983, eng] **E-30528**
- Distribution of arenaceous foraminifera in Kerguelen Plateau area [1984, eng] **E-31150**

EVOLUTION
- *Lamprocyrtis* and *Stichocorys* lineages: polycystine radiolarian evolution [1982, eng] **E-31305**
- Cenozoic radiolarians of the Atlantic basin and margins [1977, eng] **E-31308**

GEOGRAPHIC DISTRIBUTION
- Benthic foraminifera off Queen Maud Land [1983, eng] **B-29445**
- Benthic foraminifera of McMurdo Sound [1983, eng] **B-29595**
- Radiolarian stratigraphy of the Indian Ocean and antarctic waters [1981, eng] **B-30349**
- Endolithic microorganisms in extreme dry environments: analysis of a lithobiontic microbial habitat [1984, eng] **B-31365**
- Mass occurrence of protozoans in antarctic sediments [1983, eng] **B-31383**
- Recent zoogeography of antarctic plankton microfossils [1979, eng] **E-29793**
- Radiolarian distribution in the southeastern Indian Ocean [1978, eng] **E-29847**
- Distribution of arenaceous foraminifera in Kerguelen Plateau area [1984, eng] **E-31150**

MORPHOLOGY
- Benthic foraminifera off Queen Maud Land [1983, eng] **B-29445**
- Quantification of morphotypes in *Neogloboquadrina pachyderma* using Fourier shape analysis [1983, eng] **E-30519**

PHYSIOLOGY
- Application of gradient diver micro-respirometry to protozoan studies [1984, eng] **B-31121**

POPULATION
- Soil testate rhizopods of South Georgia [1983, eng] **B-29204**
- Ranking of dissolution susceptibility of planktonic foraminifera [1983, eng] **B-29289**
- Study of antarctic infusoria [1984, rus] **B-30106**
- Protozoan plankton characteristics in southwestern Pacific [1983, eng] **B-31144**

TAXONOMY
- Benthic foraminifera off Queen Maud Land [1983, eng] **B-29445**
- Zooplankton of the antarctic waters [1983, eng] **B-29459**
- Taxonomy of foraminifera in New Zealand waters [1983, eng] **B-29795**
- Protozoa of Signy Island fellfields [1984, eng] **B-30461**
- Foraminifera from raised beach deposits, Lützow-Holm Bay [1983, eng] **E-29127**
- Distribution of arenaceous foraminifera in Kerguelen Plateau area [1984, eng] **E-31150**

Psychology
- Basic results of studies on human adaptation to antarctic conditions [1983, rus] **H-29660**
- Eysenck's analysis at antarctic stations [1984, rus] **H-30210**
- Physiological effects of prolonged social isolation [1984, rus] **H-30435**
- International Biomedical Expedition to the Antarctic (IBEA) [1984, eng] **H-30584**
- Adaptation and health of man in Antarctica [1984, eng] **H-30651**
- Acclimatization neurophysiology in man [1984, rus] **H-30791**
- Research program of the international biomedical expedition to the Antarctic [1984, fre] **H-30883**

Summary of French medical and psychological research [1983, fre] H-30885
Strategy of psychological adaptation under Antarctic conditions [1984, rus] H-30943
Antarctic isolation and imaginative involvement [1984, eng] H-31083
Study of the biographic records of subjects wintering in the Antarctic applied to selection [1984, fre] H-31389
First medical investigation of an antarctic crew [1985, spa] H-31420
Psychological adaptation as a function of work experience in polar conditions [1985, rus] H-31667

Research programs

International (cont.)

Some problems of cooperative data analysis with FIBEX and SIBEX [1983, eng] B-29359
Chlorophyll *a* in the Antarctic Ocean [1982, eng] B-29378
Visual observations of the antarctic sea birds during the FIBEX cruise of the *Kaiyo Maru* [1982, eng] B-29386
Minke whale assessment cruise (IWC/IDCR) report for 1978 to 1981 [1982, eng] B-29387
Whale sighting during BIOMASS/FIBEX 1980-1981 [1982, eng] B-29388
BIOMASS newsletter, Vol.5(2) [1983, eng] B-29466
Thirty-first report of the International Whaling Commission [1981, eng] B-29747
Results from the IWC/IDCR minke marking and sightings cruise, 1979/80 [1981, eng] B-29749
Thirty-second report of the International Whaling Commission [1982, eng] B-29774
Thirty-third report of the International Whaling Commission [1983, eng] B-29880
South African and French collaborative research program on seals from Indian Ocean islands [1984, eng] B-30068
Krill stock research in the BIOMASS program [1982, pol] B-30075
Nutrient cycles and food chains in the Antarctic [1984, eng] B-30096
SCAR bulletin No.77, May 1984 [1984, eng] B-30190
BIOMASS newsletter, Vol.6, No.1, July 1981 [1984, eng] B-30573
Acoustic estimation of krill abundance [1984, eng] B-30717
Biomass of krill in the eastern part of Bransfield Strait, March 1981 [1984, eng] B-30782
Antarctic ecology [1984, eng] B-30975
BIOMASS executive. Report of the second 1984 meeting, Bremerhaven, F.R.G., 2-3 October 1984 [1984, eng] B-31016
BIOMASS newsletter, Vol.6, No.2, Dec. 1984 [1984, eng] B-31064
Meeting of BIOMASS Working Party on Bird Ecology [1984, eng] B-31086
Biology of the antarctic krill: what are the fundamental hypotheses [1984, eng] B-31192
BIOMASS Executive report of 1984 meeting, Cambridge, UK, 20-22 June, 1984 [1984, eng] B-31260
Report of Acoustic Working Party meeting to prepare for Post-FIBEX Acoustic Workshop, 1984 [1984, eng] B-31261
Thirty-fourth report of the International Whaling Commission [1984, eng] B-31268
Report on SIBEX and fish stock investigations [1984, ger] B-31302
Working Party on Fish Ecology. Report of the fourth meeting. Dammarieles-Lys, France, Aug. 25-29, 1984 [1985, eng] B-31734
Introduction to the US-USSR Weddell Polynya Expedition [1983, eng] D-29211
Earth science research at McMurdo Station, 1982-1983 [1983, jpn] E-29410
Deep sea drilling: touching the last frontier [1982, eng] E-31227
Investigation of the antarctic ice cover [1983, ger] F-29697
International cooperation in antarctic glaciation research [1983, rus] F-29740
International polar research [1984, eng] F-29859
Current state and trends in antarctic glaciological research [1983, ger] F-30761
Filchner-Ronne Ice Shelf programme, Report 1 (1984) [1985, eng] F-31127
Ice core science trench for use by glaciologists on the Greenland ice sheet [1983, eng] F-31561
Research program of the international biomedical expedition to the Antarctic [1984, fre] H-30883
Workshop on antarctic climate data [1984, eng] I-30184
Report on scientific activity in meteorology and atmospheric physics 1979-1982 [1983, rus] I-31015
Present state of Soviet research on the Arctic and Antarctic oceans [1978, eng] J-30055
Southern Ocean [1978, eng] J-30666
Soviet-American investigations in the southern ocean [1979, rus] J-31079
Oceanographic data collected aboard R/V *Melville* during Jan.-Feb. 1979 and AGS *Yelcho* during Apr.-May 1979 as a part of DRAKE 79 [1979, eng] J-31101
Activities of Japanese earth science research in the McMurdo Sound region in the 1983-1984 season [1984, eng] [illegible]31600
Development of the Antarctic Treaty System—trends and issues [1984, eng] M-30440
Multilateral cooperation in antarctic marine ecosystem research [1982, eng] M-31676

Japan

JARE's winter activities, 1981-1982 [1984, eng] A-30127
JARE's winter activities, 1982-1983 [1984, eng] A-30128
Polar patrol balloon: I. Balloon system [1984, jpn] A-30623
Polar patrol balloon: II. Observation plan [1984, jpn] A-30624
Japanese antarctic research, 1984 report [1984, eng] A-31011
Monograph series Science in Antarctica [1984, jpn] A-31400
Record of antarctic observations: its content and significance [1983, jpn] A-31638
Proceedings of the Fifth Symposium on Antarctic Biology [1982, eng] B-29374
Proceedings of the Sixth Symposium on Polar Biology [1984, eng] B-30888
Reconnaissance survey of the Sör Rondane Mountains by JARE, 1984 [1984, jpn] C-30622
Activities of the summer party, 24th JARE, 1982-1983 [1984, jpn] D-30621
Japanese geomorphological research in the Lützow-Holm Bay region [1984, jpn] E-31396
Glaciological research program in East Queen Maud Land, 1982-1983 [1984, eng] F-30040
Meteorological data at Mizuho Station, Antarctica, 1982 [1983, eng] I-29196
Proceedings of the sixth symposium on coordinated observations of the ionosphere and the magnetosphere in the polar regions [1984, eng] K-30494

Korea

Korean report on krill research [1983, eng] B-29954

New Zealand

Antarctic, Vol.10, No.3 [1983, eng] A-29109
Antarctic, Vol.10, No.5 [1984, eng] A-30191
New Zealand antarctic research programme 1984-85 [1984, eng] A-30329
New Zealand antarctic research report to SCAR No.26, 1984 [1984, eng] A-31010
Antarctic, Vol.10, No.7 [1984, eng] A-31695
New Zealand's survival training and search and rescue capability [1983, eng] G-31565
New Zealand meteorological service in Antarctica [1984, eng] I-30581

Norway

Adventure in the Antarctic [1978, nor] D-30880

Hydrometeorological characteristics of snow and ice over Antarctica [1983, eng] F-29433
Polar ice cap albedo as a function of air temperature [1981, eng] F-30057
Impurities in snow: effects on albedo and snowmelt (review) [1984, eng] F-30484
Thermal metamorphism of antarctic sea ice [1984, rus] F-30847
Surface albedo data for climatic modeling [1983, eng] I-28999
Solar radiation and snow albedo at Mizuho Station [1983, eng] I-30351
CHEMISTRY
Chemical composition of Amery lakes [1982, rus] E-28974
Firn sampling for heavy metals [1983, ger] F-29166
Acidity of antarctic snow: a natural reference level for acid rains [1980, eng] F-29365
Ions at ultratrace levels in antarctic snow and ice [1984, eng] F-29705
Use of the method of isotope glaciology for studying nuclear explosion products in Antarctica [1982, eng] F-30059
Anomalous isotopic composition of hydrogen in the snow cover of central Antarctica [1979, rus] F-30332
Chemical investigation of polar snow strata [1974, jpn] F-30365
Solar particle flux and nitrate in South Pole snow [1983, eng] F-30376
Chemical composition of snow at the Riiser-Larsen Ice Shelf [1984, eng] F-30715
Isotopic effects during snow formation [1984, eng] F-31075
Sulphur in antarctic snow and firn [1985, ger] F-31623
Record of global pollution in polar snow and ice [1985, eng] F-31682
Ionic balance of antarctic snow: a 10-year detailed record [1984, eng] F-31720
Atmosphere to snow transfers in Antarctica [1983, eng] I-30334
Numerical response of the middle atmosphere to the 11-year solar cycle [1984, eng] I-30413
Chemistry of precipitation in relation to precipitation type [1982, eng] I-30429
Inorganic substance content in atmospheric precipitation at Mirnyy Station [1984, rus] I-30872
Glaciological trace element investigations at German antarctic stations [1985, ger] I-31612
COMPACTION
Some experimental results on snow compaction [1983, eng] F-29107
Snow densification on Mizuho Plateau [1983, eng] F-29275
Compressed snow-ice airstrip construction in Antarctica [1982, eng] F-29475
Internal friction of compressed snow [1974, jpn] F-30360
Densification of snow in East Antarctica [1974, jpn] F-30366
Compacted snow as a pavement material for runway construction [1984, eng] F-30577
Building of runways for wheeled airplanes in deep snow [1983, rus] G-29657
Runway construction at Molodezhnaya Station [1983, eng] G-31523
CONSTRUCTION
Compressed snow-ice airstrip construction in Antarctica [1982, eng] F-29475

Snow
CONSTRUCTION *(cont.)*
Snowcraft/survival school: learning to work in Antarctica [1984, eng] G-30562
Ice plug anchor—development of a new anchor for use in snow and ice [1985, eng] G-31474
Runway construction at Molodezhnaya Station [1983, eng] G-31523
Problems in runway construction on deep snowfields [1978, eng] G-31708
CORES
Snow densification on Mizuho Plateau [1983, eng] F-29275
MEM spectrum analysis of snow densities [1983, jpn] F-29961
Impurities in snow: effects on albedo and snowmelt (review) [1984, eng] F-30484
Use of snow airfields in Antarctica for determination of accumulation rate and atmospheric precipitation [1985, rus] F-31660
CRYSTALS
Summer snow crystal shapes on Mizuho Plateau [1983, eng] F-29271
Elemental compositions and concentrations of microspherules in snow and pack ice from the Weddell Sea [1983, eng] F-30514
DENSITY
Snow densification on Mizuho Plateau [1983, eng] F-29275
Power spectral analysis of snow densities at Mizuho Station [1983, eng] F-29276
Glaciological studies on the traverse to Dome C [1983, rus] F-29728
Snow stratigraphy in katabatic wind region of Wilkes Land [1983, eng] F-29817
MEM spectrum analysis of snow densities [1983, jpn] F-29961
Density of surface snow cover along routes S, H and Z [1984, eng] F-30043
Internal friction of compressed snow [1974, jpn] F-30360
Snow structure and thermal conductivity at Mizuho [1974, jpn] F-30364
Densification of snow in East Antarctica [1974, jpn] F-30366
Compacted snow as a pavement material for runway construction [1984, eng] F-30577
DISTRIBUTION
Snow and ice mapping in Antarctica, Iceland and Cape Cod [1983, eng] F-29310
Potential impact of snow and ice variations on the heat budget [1982, eng] F-29849
Physical conditions of fast ice formation in East Antarctica [1979, eng] F-31059
Quantitative analysis of snow-line zonality [1984, chi] F-31139
DRIFTING
Geocryogenic morphology at Seymour Island (Marambio) Antarctica: a progress report [1983, eng] E-29079
Snow storm with strong wind in Antarctica [1983, jpn] F-29962
Snowdrift patches on King George (Waterloo) Island [1984, rus] F-31606
Introduction to Showa Station—(5): Buildings [1983, jpn] G-29221
ELECTRICAL PROPERTIES
Noises in the east antarctic ice sheet [1984, eng] F-30103
Snow structure and thermal conductivity at Mizuho [1974, jpn] F-30364
EXPLOITATION
Using drift snow for sea pier construction in Antarctica [1983, rus] G-29731
FORMATION
Isotopic effects during snow formation [1984, eng] F-31075
HEAT EXCHANGE
Data problems with heat flux in surface snow at Mizuho Station [1983, eng] F-29266
INSTRUMENTS
Radar measurements of snowcover thickness [1984, eng] F-31679
MAPS AND CHARTS
Geomorphology of the Ablation Point massif, Alexander Island [1983, eng] E-30930
MASS BALANCE
International cooperation in glaciology [1983, rus] F-29051
MECHANICAL PROPERTIES
Building deformation from snow and ice loads [1983, ger] F-29169
Compressed snow-ice airstrip construction in Antarctica [1982, eng] F-29475
Internal friction of compressed snow [1974, jpn] F-30360
Densification of snow in East Antarctica [1974, jpn] F-30366
METAMORPHISM
Thermal properties and the mechanics of natural ice [1983, rus] F-29186
MODELS
Snow densification on Mizuho Plateau [1983, eng] F-29275
Impurities in snow: effects on albedo and snowmelt (review) [1984, eng] F-30484
Isotopic effects during snow formation [1984, eng] F-31075
Albedo of soot-contaminated snow [1983, eng] I-29101
MORPHOLOGY
Studies of cryptoendolithic microbial communities in the Antarctic cold desert [1983, eng] B-30693
Snow stratigraphy at Dome C [1984, eng] F-30380
PHYSICAL PROPERTIES
Some experimental results on snow compaction [1983, eng] F-29107
Thermal properties and the mechanics of natural ice [1983, rus] F-29186
MEM spectrum analysis of snow densities [1983, jpn] F-29961
Model tests and in situ behaviour of prestressed anchors in snow and ice [1984, eng] G-31238
POLLUTION
Firn sampling for heavy metals [1983, ger] F-29166
Ions at ultratrace levels in antarctic snow and ice [1984, eng] F-29705
Use of the method of isotope glaciology for studying nuclear explosion products in Antarctica [1982, eng] F-30059
Impurities in snow: effects on albedo and snowmelt (review) [1984, eng] F-30484
Environmental pollution of chlorinated hydrocarbons around Showa Station [1983, jpn] G-29406
Chemistry of precipitation in relation to precipitation type [1982, eng] I-30429
Environmental pollution of chlorinated hydrocarbons in the Antarctic [1984, jpn] I-31397
RADIATION
Hydrometeorological characteristics of snow and ice over Antarctica [1983, eng] F-29433
RADIOACTIVITY
Use of the method of isotope glaciology for studying nuclear explosion products in Antarctica [1982, eng] F-30059
Anomalous isotopic composition of hydrogen in the snow cover of central Antarctica [1979, rus] F-30332
Chemical investigation of polar snow strata [1974, jpn] F-30365
STRATIGRAPHY
Some experimental results on snow compaction [1983, eng] F-29107
Power spectral analysis of snow densities at Mizuho Station [1983, eng] F-29276
Snow stratigraphy in katabatic wind region of Wilkes Land [1983, eng] F-29817
Chemical investigation of polar snow strata [1974, jpn] F-30365
Snow stratigraphy at Dome C [1984, eng] F-30380
Studies of ice formation and ice fabric on the Law Dome, Antarctica [1984, chi] F-30830
Glaciological and geocryological studies on King George Island [1984, rus] F-30849
Possibility of joint application of nivometric and stratigraphic methods of measuring accumulation for more accurate determination of accumulation rate in the central areas of Antarctica [1985, rus] F-31659
Isotopic diffusion in cold snow and firn [1985, eng] F-31690
STRUCTURE
Snow structure and thermal conductivity at Mizuho [1974, jpn] F-30364
Age difference between polar ice and trapped air bubbles [1984, eng] F-30724
Microparticles in ice cores from Antarctica and Greenland [1984, chi] F-30831
Use of snow airfields in Antarctica for determination of accumulation rate and atmospheric precipitation [1985, rus] F-31660
SURFACE FEATURES
Snow stratigraphy in katabatic wind region of Wilkes Land [1983, eng] F-29817
Direction of long axis of a sastrugi [1984, eng] F-30047
TEMPERATURE
Some experimental results on snow compaction [1983, eng] F-29107

Data problems with heat flux in surface snow at Mizuho Station [1983, eng] **F-29266**
Glaciological studies during the First Indian Antarctic Expedition [1983, eng] **F-29450**
Snow structure and thermal conductivity at Mizuho [1974, jpn] **F-30364**
Glaciological studies of the Filchner Ice Shelf, 1983/84 [1984, ger] **F-31155**
POLEX-South data, Part 5, 1981 [1983, eng] **I-29195**
Near surface temperature regime of the Antarctic [1984, eng] **I-30753**
THAWING
Impurities in snow: effects on albedo and snowmelt (review) [1984, eng] **F-30484**
Estimates of future sea level rise [1984, eng] **F-31694**

Taxonomy and distribution of some *Ceratium* species in the antarctic ocean [1984, eng] **B-30890**
Diatom distribution in the Indian Ocean [1984, eng] **B-30891**
Algal taxonomy and ecology on Mt. Erebus [1984, eng] **B-31367**
Monoraphidinae diatoms in the Kerguelen Islands [1983, fre] **B-31713**
Benthic marine algal flora of Antarctica with special reference to *Himantothallus, Ascoseira,* and the Ceramiaceae [1984, eng] **B-31722**

Thallophyta-Fungi
Microflora-microfauna interactions in moss peat decomposition [1983, eng] **B-31066**
Mass occurrence of protozoans in antarctic sediments [1983, eng] **B-31383**

ECOLOGY
Temperature effect on *Candida saké* growth [1984, eng] **B-30597**
Effect of freeze thaw cycles on antarctic black yeast [1984, eng] **B-30598**

GEOGRAPHIC DISTRIBUTION
Evolution of antarctic yeasts [1982, eng] **B-29895**
Investigation of antarctic soil microorganisms and their interrelationships [1985, ger] **B-31728**

MORPHOLOGY
Evolution of antarctic yeasts [1982, eng] **B-29895**
Leptoglossum omnivorum n. sp. from Antarctica [1984, eng] **B-30279**

PATHOLOGY
Effect of freeze thaw cycles on antarctic black yeast [1984, eng] **B-30598**

PHYSIOLOGY
Temperature effect on *Candida saké* growth [1984, eng] **B-30597**
Effect of freeze thaw cycles on antarctic black yeast [1984, eng] **B-30598**
Cryptococcus friedmannii, a new species of yeast from the Antarctic [1985, eng] **B-31382**
Cryptococcus lupi sp. nov., an antarctic basidioblastomycete [1982, eng] **B-31440**
Cryptococcus socialis sp. nov. and *Cryptococcus consortionis* sp. nov., antarctic basidioblastomycetes [1985, eng] **B-31467**

TAXONOMY
Evolution of antarctic yeasts [1982, eng] **B-29895**
New species of antarctic yeasts [1982, eng] **B-29911**
Cryptococcus friedmannii, a new species of yeast from the Antarctic [1985, eng] **B-31382**
Cryptococcus lupi sp. nov., an antarctic basidioblastomycete [1982, eng] **B-31440**
Cryptococcus socialis sp. nov. and *Cryptococcus consortionis* sp. nov., antarctic basidioblastomycetes [1985, eng] **B-31467**

Thallophyta-Lichens
Colonization and recovery by cryptogams on Deception Island [1984, eng] **B-29396**
Primary production in East Ongul Island mosses [1983, jpn] **B-29407**
Stereochemistry of 7beta-Acetoxy-22-hydroxyhopane from a South Georgia lichen [1983, eng] **B-29918**

Thallophyta-Lichens ***(cont.)***

Endolithic microorganisms in extreme dry environments: analysis of a lithobiontic microbial habitat [1984, eng] **B-31365**
Biogeochemical adaptations of cryptogams to natural extreme environments [1984, rus] **B-31568**

ECOLOGY
Distribution patterns of lichens in the Pacific Region [1983, eng] **B-29205**
Studies of cryptoendolithic microbial communities in the Antarctic cold desert [1983, eng] **B-30693**
Ecological and chemical investigations of lichens from South Georgia and the maritime Antarctic [1984, eng] **B-31574**

GEOGRAPHIC DISTRIBUTION
Distribution patterns of lichens in the Pacific Region [1983, eng] **B-29205**
New subantarctic species of the lichen genus *Peltularia* [1984, eng] **B-30628**
Phytogeography of Antarctica [1984, eng] **B-30669**
Xanthoria elegans and its synonyms in Antarctica [1984, eng] **B-31123**
Biota of a lateral moraine and hinterland of the Blue Glacier, South Victoria Land, Antarctica [1985, eng] **B-31579**

MORPHOLOGY
Flora of *Dakshin Gangotri* in Antarctica [1983, eng] **B-29455**
Xanthoria elegans and its synonyms in Antarctica [1984, eng] **B-31123**

PHYSIOLOGY
Ecological and chemical investigations of lichens from South Georgia and the maritime Antarctic [1984, eng] **B-31574**

TAXONOMY
Distribution patterns of lichens in the Pacific Region [1983, eng] **B-29205**
New subantarctic species of the lichen genus *Peltularia* [1984, eng] **B-30628**
Xanthoria elegans and its synonyms in Antarctica [1984, eng] **B-31123**

Thawing
See under: Glacier ice; Ice; Ice sheet; Shelf ice; Snow

Thermal exchange
See: Heat exchange

Thickness
See under: Frazil ice; Glacier ice; Ice; Ice sheet; Pack ice; Sea ice; Shelf ice; Snow

Tides
Glacier flexure and the position of grounding lines: measurements by tiltmeter on Rutford Ice Stream, Antarctica [1984, eng] **F-30483**
Thermohaline circulation below the Ross Ice Shelf [1984, eng] **J-29227**
Numerical simulations of the Ross Sea tides [1984, eng] **J-29228**
Polish 2nd Antarctic Expedition oceanographic study of Ezcurra Inlet [1980, eng] **J-29283**
Tidal currents in the Pacific Basin and Campbell Plateau regions [1983, eng] **J-29512**
Winter sea level fluctuations in Alasheyev Bight [1983, rus] **J-29735**
Oceanographic data of the 23rd Japanese Antarctic Research Expedition from November 1981 to April 1982 [1984, eng] **J-30033**
Oceanographic data from the 24th JARE Nov 1982 to Apr 1983 [1984, eng] **J-30511**
Current, temperature and salinity beneath George VI Ice Shelf [1984, eng] **J-30860**
Potential effect of CO2 warming on sub-ice-shelf circulation and basal melting [1984, eng] **J-31113**
Vertical tidal motion of Filchner Ice Shelf [1984, ger] **J-31160**
Hydrographic investigations at the edge of the Filchner Ice Shelf [1984, ger] **J-31165**
Applications of satellite altimetry to oceanography and geophysics [1984, eng] **J-31718**
Long-period solar tides at the South Pole [1983, eng] **L-30248**
Gravity tides on the Filchner Ice Shelf [1985, eng] **L-31614**

Topographic survey
Topographic map of Seymour Island from nonmetric aerial photographs [1984, eng] **C-30794**
Mapping activities in Antarctica [1983, eng] **C-30968**
Special colour enhancement for three channels having similar radiances [1984, eng] **C-31454**
Geological interpretation of satellite images of Antarctica [1983, rus] **E-29292**
Glaciological and geocryological studies on King George Island [1984, rus] **F-30849**
D/E *Gizhiga* operations off Hobbs Coast and organization of the new antarctic station Russkaya [1984, rus] **F-30863**
Leveling and gravity surveys at Showa Station [1984, eng] **L-31598**

Volcanic evolution of Heard and McDonald Islands [1983, eng] E-29636
Volcanic activity in the Kerguelen Islands [1983, eng] E-29638
Volcanology of Possession Island, Crozet Archipelago (TAAF) [1983, eng] E-29640
Record of ice levels contained in volcanic rocks of Marie Byrd Land [1983, eng] E-29641
Seismological observation on Mount Erebus, 1980-1981 [1983, eng] E-29642
Nd and Sr isotope geochemistry of leucite-bearing lavas from Gaussberg, East Antarctica [1983, eng] E-29643
Geology of Scott and Balleny Islands [1982, eng] E-29669
Geologic study of South Shetland Islands [1983, eng] E-29673
Isotopic studies on continental alkali basalts from Marie Byrd Land [1983, eng] E-29799
Geochemistry of Cambrian volcanics of the Bowers Supergroup [1984, eng] E-29858
Geology of the Indian Ocean Subantarctic Islands [1982, eng] E-29866
Marine intraplate plutonism: example of Kerguelen Islands [1983, fre] E-29964
Infrared survey of geothermal fields in Kerguelen Archipelago [1984, eng] E-29971
Plate motions and aseismic ridges in the Indian Ocean [1984, eng] E-29972
Kerguelen hotspot source for Rajmahal Traps and Ninetyeast Ridge [1983, eng] E-30029
Geology of islands in southern Bransfield Strait, Antarctic Peninsula [1984, eng] E-30114
Japanese activities at McMurdo Sound during 1981-1982 season [1984, eng] E-30129
Geology of the LeMay Group, Alexander Island [1984, eng] E-30135
Lawrence Peaks volcanics, North Victoria Land [1984, eng] E-30150
Tertiary calc-alkaline island-arc volcanic suite of the South Shetland Islands [1980, eng] E-30193
1980 annual meetings [1980, eng] E-30197
Structural evolution of Melville Peak volcano, King George Island [1981, eng] E-30208
Volcanic activity of Mount Melbourne, Northern Victoria Land [1983, eng] E-30225
Discovery of a Tertiary granite pluton, northern Victoria Land [1983, eng] E-30229
Volcanic geology of Turks Head, Tryggve Point, and Minna Bluff [1983, eng] E-30237
Volcanic activity and seismicity of Mount Erebus, 1982-1983 [1983, eng] E-30240
Reconnaissance of hyaloclastites in the western Ross Sea region [1983, eng] E-30249
Overriding of the Indian-Antarctic Ridge [1984, eng] E-30289
Quantitative evaluation of fractional crystallization in Bouvet Island lavas [1982, eng] E-30319
Extensive volcanism associated with the separation of Australia and Antarctica [1984, eng] E-30468
Antarctic Cenozoic glacial workshop [1984, eng] E-30583
Problematical petrographic successions on Marion Island [1983, eng] E-30835
Seismic activity in Mount Erebus, 1982-83 [1984, eng] E-30912
Catalog of chemical analyses of magmatic rocks from Antarctica [1983, rus] E-31021
Geological map of Antarctica, scale 1:5,000,000 [1976, rus] E-31032
Geology of Pourquoi Pas Island [1983, eng] E-31036
Geology of Ducloz Head area, South Georgia [1983, eng] E-31038
Geology of Horseshoe and Lagotellerie Islands, Marguerite Bay, Graham Land [1983, eng] E-31043
Geology of part of northern Palmer Land [1984, eng] E-31078
Tephra from New Zealand in southern ocean sediments [1984, eng] E-31089
Late Mesozoic, non-marine conglomeratic sequences of northern Antarctic Peninsula (the Botany Bay Group) [1984, eng] E-31115
Geology of the Arrowsmith Peninsula and Blaiklock Island [1984, eng] E-31117
Age of volcanoes and granite basement of the Auckland Islands [1983, eng] E-31130
Geology of Turret Point, King George Island [1982, eng] E-31219
Mesozoic stratiform volcanic-sedimentary succession and Andean intrusions at Admiralty Bay, King George Island [1982, eng] E-31220
Structure and succession of Penguin Island volcano [1982, eng] E-31221
Geological investigations on King George and Nelson Islands, 1980-1981 [1982, eng] E-31222
Geology of parts of Central and West Palmer Land [1984, eng] E-31304
Suspect terranes in North Victoria Land [1984, eng] E-31368
Sources of oceanic basalts: Radiogenic isotopic evidence [1985, eng] E-31404
Volcanism in the southernmost Patagonian Cordillera, Chile [1984, eng] E-31472
Aspects of a glassy meteorite from the moon bearing on some problems in extraterrestrial glass-making [1984, eng] E-31501
Cumulate origin of high-alumina basalts in specific calc-alkaline series of the South Shetland arc, West Antarctica [1983, eng] E-31672
Sea-floor evolution: rare-earth evidence [1971, eng] E-31737
Volcanic events linked to pH record in Brunt Ice Shelf firn [1983, eng] F-29277
Core processing and analyses of ice cores drilled at the South Pole [1983, eng] F-30405
Impurities in snow: effects on albedo and snowmelt (review) [1984, eng] F-30484
Paleogene and late Cretaceous pelagic sequence from the Kerguelen-Heard plateau [1983, fre] J-28993
Bathymetry of the North Victoria Land continental margin [1983, eng] J-28994
Atmospheric infrasound from volcanic eruptions in 1982 [1983, eng] K-30945
Magnetic studies of upper crustal structure in West Antarctica and the boundary with East Antarctica [1983, eng] L-29555
Geophysical studies on Mount Erebus [1983, eng] L-30239
Magnetic anomalies—India and Antarctica [1984, eng] L-31152

GEOGRAPHIC INDEX

Adelaide Island
- Ecological and chemical investigations of lichens from South Georgia and the maritime Antarctic [1984, eng] B-31574
- C130 and DHC5 air drops in Antarctica [1983, eng] G-31532

Adélie Coast
- Discovery of French austral and antarctic lands [1983, fre] B-29500
- Olfactory experiments on some antarctic birds [1984, eng] B-30508
- Atmospheric trace elements in antarctic prehistoric ice collected at a coastal ablation area [1984, eng] F-31721
- Topographically forced surface katabatic winds in Adélie Land [1980, eng] I-29804
- Katabatic wind in Adélie Land [1983, eng] I-30698
- Numerical simulation of katabatic flow [1983, eng] I-30699

Admiralty Bay
- Experience of Polish ocean lines in the service of antarctic expeditions [1981, pol] G-29983

Alasheyev Bight
- Thermal metamorphism of antarctic sea ice [1984, rus] F-30847
- Winter sea level fluctuations in Alasheyev Bight [1983, rus] J-29735

Alexander Island
- Palaeoclimatic significance of some Mesozoic antarctic fossil floras [1983, eng] E-29630
- Geology of the LeMay Group, Alexander Island [1984, eng] E-30135
- Lower Cretaceous ammonites in Alexander Island [1983, eng] E-30656
- Geomorphology of the Ablation Point massif, Alexander Island [1983, eng] E-30930
- Petrology of the Rouen Mountains, northern Alexander Island [1983, eng] E-31040
- Sedimentation of Ablation Valley, Alexander Island [1985, eng] E-31585
- On late-glacial and holocene glacier fluctuations in maritime West Antarctica [1983, eng] F-29863
- Ice, water and energy balances of Spartan Glacier, Alexander Island [1983, eng] F-31044
- Glaciological characteristics of Spartan Glacier, Alexander Island [1983, eng] F-31047

Allan Hills
- Meteorite search and recovery, Allan Hills, 1981-82 [1983, eng] E-29634
- Climate implications of low density meteorites [1983, eng] E-29635
- Sedimentary petrology of Permian-Triassic rocks in Allan Hills [1983, eng] E-30231
- Gondwana rocks of the Allan Hills [1983, eng] E-30232
- Antarctic search for meteorites, 1982-1983 [1983, eng] E-30387
- Search for meteorites in the Allan Hills/Elephant Moraine area, 1982-1983 [1983, eng] E-30388
- Antarctic search for meteorites [1983, eng] E-31070
- Allan Hills meteorite icefield triangulation net [1983, eng] F-29633
- Radioactive dating of Byrd core and Allan Hills ice [1983, eng] F-30402

Amery Ice Shelf
- Amery Ice Shelf topography from satellite radar altimetry [1983, eng] C-29601
- Chemical composition of Amery lakes [1982, rus] E-28974
- Deep ice cores from Antarctica [1974, jpn] F-30367

Amsterdam Island
- Discovery of French austral and antarctic lands [1983, fre] B-29500
- Garganey on St. Paul and Amsterdam Islands [1983, eng] B-30591
- Population increase in subantarctic fur seals at Amsterdam Is. [1983, eng] B-30837
- Study of oxygen red line in twilight [1984, rus] K-30180

Amundsen Bay
- Seismic profiles of Amundsen and Lützow-Holm Bays, 1982 [1984, eng] E-30915

Amundsen-Scott Station
- Unveiling the secrets of the ice continent [1984, rus] A-31061
- Mapping activities in Antarctica [1983, eng] C-30968
- Nitrate concentrations in antarctic ice [1983, eng] F-30375
- Solar particle flux and nitrate in South Pole snow [1983, eng] F-30376
- 237-meter ice core from South Pole station [1983, eng] F-30404
- Core processing and analyses of ice cores drilled at the South Pole [1983, eng] F-30405
- South Pole pit stratigraphic studies [1983, eng] F-30406
- South Pole ice core processing and microparticle analysis [1983, eng] F-30407
- Baseline acidity of ancient precipitation from the South Pole [1984, eng] F-30570
- Ionic balance of antarctic snow: a 10-year detailed record [1984, eng] F-31720
- Survival of human parainfluenza viruses in the South Polar environment [1983, eng] H-29250
- Respiratory virus infections during the winter at the South Pole [1983, eng] H-30694
- Decline in parainfluenzavirus specific antibody avidity before common cold [1983, eng] H-30695
- Meteorological conditions accompanying a spectacular ice crystal optical display [1984, eng] I-29861
- Ultraviolet radiation at South Pole [1984, eng] I-30417
- Particle concentrations at the South Pole, on meteorological and climatological time scale [1984, eng] I-30505
- Geophysical monitoring for climatic change no.11: summary report 1982 [1983, eng] I-30548
- On the interaction of aerosol with meteorology [1984, eng] I-30672
- Antarctic hydroxyl radical measurements [1983, eng] I-30701
- Meteorological and aerosol experiments in Antarctica [1983, eng] I-30703
- Measurement of the column densities of water and trace gases [1983, eng] I-30706
- Feasibility of long duration ballooning in Antarctica [1984, eng] I-31100
- Influence of the southern oscillation on atmospheric carbon dioxide [1977, eng] I-31430
- Ammonia and ammonium concentrations in the antarctic atmosphere [1983, eng] I-31632
- Aerosol measurements at four background sites [1983, eng] I-31648
- Seasonal components of atmospheric CO2: information from new approaches to the decomposition of seasonal time series [1985, eng] I-31649
- Dayside auroral dynamics [1984, eng] K-29744
- Antarctic automatic geophysical observatories [1983, eng] K-30948
- Magnetic pulsation activity at South Pole Station [1983, eng] K-30949
- Solar seismology at the South Pole: Studies of solar oscillations [1983, eng] K-30950
- Observations of solar oscillations at the South Pole [1983, eng] K-30951
- Suppression of natural VLF noise by whistlers [1983, eng] K-30958
- Polar cusp dynamics [1985, eng] K-31265
- New VLF method for studying burst precipitation near the plasmapause [1985, eng] K-31692
- Mode 1S1 for gapped data at the South Pole [1984, eng] L-29741
- Long-period solar tides at the South Pole [1983, eng] L-30248

Amundsen Sea
- Distribution and seasonal peculiarities of plankton in the Amundsen Sea [1985, rus] B-31664
- West antarctic sea ice [1984, eng] F-31106

Antarctic Peninsula
- Argentine report to SCAR, No.26, 1984 [1984, eng] A-31009
- Anonymous heroes [1982, spa] A-31486
- Seasonal plankton succession in coastal waters of the Antarctic Peninsula [1982, rus] B-28976
- Ontogenetic migration of antarctic Euphausiids [1982, rus] B-28977
- Underwater vocalizations of Weddell seals [1983, eng] B-29215
- Amphipoda from the Southern Ocean [1983, eng] B-29321
- Krill populations in Bransfield Strait [1983, eng] B-29356
- Food of fish around the Antarctic Peninsula [1981, eng] B-29836
- Demographic characteristics of an antarctic plunderfish [1983, eng] B-29906
- Variation in marine conditions and patterns of krill distribution off western Antarctic Peninsula [1984, eng] B-29945

Antarctic Peninsula *(cont.)*
Supercooling and winter survival in terrestrial arthropods [1982, eng] B-29955
Fish distribution in Scotia Sea and off the Antarctic Peninsula [1983, eng] B-30339
FIBEX cruise zooplankton data [1984, eng] B-30431
Echinoderm studies along the Antarctic Peninsula [1983, eng] B-30673
Field and laboratory studies of antarctic krill, austral summer 1982-83 [1983, eng] B-30678
Plant communities of the Antarctic Peninsula near Palmer Station [1983, eng] B-30688
Zoological studies in the area of Bellingshausen Station [1984, rus] B-30850
Biogeography of the Antarctic Peninsula and its adjacent archipelagos and seas [1984, spa] B-30886
Utilization of phytoplankton by antarctic copepods [1983, eng] B-31746
Bottom contours near the Antarctic Peninsula and South Shetland Islands [1982, rus] E-28972
Geological history of the Scotia Arc and the Antarctic Peninsula [1979, spa] E-28995
Deformation of granitic plutons in eastern Palmer Land [1983, eng] E-29071
Ameghino refuge geology, San Martin Land, Antarctic Peninsula [1983, spa] E-29134
Slopes, hillsides, and walls on the Antarctic Peninsula [1983, ger] E-29514
Evolution of the Scotia Arc: a review [1983, eng] E-29570
Antarctic Peninsula—a late Mesozoic-Cenozoic arc (review) [1983, eng] E-29571
Jurassic Latady Formation, southern Antarctic Peninsula [1983, eng] E-29575
Evolution of Late Mesozoic sedimentary basins in the northern Antarctic Peninsula [1983, eng] E-29578
Age of volcanism in the Antarctic Peninsula [1983, eng] E-29579
Active plate margin of the Antarctic Peninsula [1983, eng] E-29583
Origins and implications of garnet in Antarctic Peninsula rocks [1983, eng] E-29585
Rb-Sr constraints on the ages of basement rocks of the Antarctic Peninsula [1983, eng] E-29587
Geology of islands in southern Bransfield Strait, Antarctic Peninsula [1984, eng] E-30114
Exploration of mineral zones [1984, spa] E-30602
Lower Cretaceous bivalve biostratigraphy of Antarctica [1983, eng] E-30660
Preliminary results of geological investigations made during the 27th Soviet Antarctic Expedition [1984, rus] E-30845
Late Mesozoic, non-marine conglomeratic sequences of northern Antarctic Peninsula (the Botany Bay Group) [1984, eng] E-31115
Geological observations on Cape Fairweather [1983, spa] E-31232
First attempt at structural interpretation of Landsat images of west antarctic mountain regions [1985, rus] E-31654
Subglacial morphology from Ellsworth Mountains to the Antarctic Peninsula [1983, eng] F-29568
Ice-shelf densities from a comparison of radio echo and seismic soundings [1984, eng] F-30480
Chilean antarctic deployment of automatic weather stations [1983, eng] G-31517
Use of wind and solar energy as a power supply for satellite automatic weather sensing stations in Antarctica [1983, eng] G-31555
Variability of atmospheric circulation at the surface of the South Pacific Ocean in summer [1984, eng] I-31104
Si/P ratio as indicator of mixing zone [1982, rus] J-28975
Bathymetry of the Scotia Arc and Antarctic Peninsula regions [1984, eng] J-31493
Cretaceous and early Tertiary paleomagnetic results from the Antarctic Peninsula [1984, eng] L-30271
Crustal growth of the Antarctic Peninsula [1985, eng] L-31402

Antipodes Islands
Petrels of Antipodes, Prince Edward and Gough Islands [1983, eng] B-29689

Anvers Island
Breeding season time budgets of the Southern Black-backed gull in Antarctica [1984, eng] B-31056
Mineral exploration on Antarctic Peninsula [1983, spa] E-29300
Satellite measurement of antarctic glacier drift [1984, ger] F-30878

Arctowski Station
Physiological effects of prolonged social isolation [1984, rus] H-30435

Argentine Islands
Ecological and chemical investigations of lichens from South Georgia and the maritime Antarctic [1984, eng] B-31574
Methods for determining the height of maximum electron concentration of the *F*2-layer [1983, eng] K-30721
Spread-*F* ionospheric irregularities and their relationship to stable auroral red arcs at magnetic mid-latitudes [1984, eng] K-30722

Arrowsmith Peninsula
Geology of the Arrowsmith Peninsula and Blaiklock Island [1984, eng] E-31117

Atka Bay
Investigations of cosmic dust in the antarctic shelf ice [1985, ger] E-31621
R/V *Polarstern* weather station operation, 1982-1983 [1983, ger] I-29003

Atka Iceport
Radio communication with the Antarctic via satellite [1982, ger] G-28988

Auckland Islands
New Zealand sea lion [1981, eng] B-30710
Glucosephosphate isomerase polymorphism in New Zealand ling *Genypterus blacodes* [1982, eng] B-31186
Age of volcanoes and granitic basement of the Auckland Islands [1983, eng] E-31130

Balleny Islands
Distribution of nutrient salt and phytoplankton in the Antarctic Ocean [1982, eng] B-29377
Nototheniidae among krill off Balleny Islands [1983, eng] B-30340
Geology of Scott and Balleny Islands [1982, eng] E-29669
Tephra from New Zealand in southern ocean sediments [1984, eng] E-31089

Barne, Cape
Th-230/U-234 chronology of mirabilite on Ross Island [1984, eng] E-30927

Beacon Valley
Glacial geology and soils in Beacon Valley [1983, eng] E-30397

Beardmore Glacier
Structurally preserved plants from the Beardmore Glacier area [1983, eng] E-30247

Beauchêne Island
Beauchêne Island: a historical account [1984, eng] A-30188

Belgrano II Station
L-band satellite communication experiment in the Antarctic [1982, ger] K-29850

Belgrano Station
5-HIAA and VMA variations in Belgrano Station population [1983, spa] H-29144
Influence of the interplanetary environment on auroral zones [1983, spa] K-29152
Spectral behaviour of disturbances observed in the southern auroral zone [1982, eng] K-30574

Bellingshausen Sea
Atlas of Fish Larvae of the Southern Ocean [1983, eng] B-29245

Bellingshausen Station
Parasite infestations and food of animals near Bellingshausen Station [1984, ger] B-30749

Bertrab Nunatak
Geology of Bertrab Nunatak [1983, spa] E-29156

Bird, Cape
Chemistry of guano soils at Cape Bird [1984, eng] E-29713
Ammonia and enzyme in guano soils of Cape Bird [1984, eng] E-29714

Bird Island
Interspecific breeding in giant petrels at South Georgia [1982, eng] B-29206
Collection of blood samples and gonad inspection in albatrosses [1984, eng] B-30119
Food conversion metabolism in albatross chicks [1984, eng] B-30659
Breeding and feeding of brown skuas on Bird Island [1985, eng] B-31584

Black Coast
Geology of parts of the Wilkins and Black Coasts, Palmer Land [1984, eng] E-31077

Blackburn, Mount
Reconnaissance geologic map of the Mt. Blackburn quadrangle, Transantarctic Mountains, Antarctica [1985, eng] E-31577

Blaiklock Glacier
- Geology of the Shackleton Range: III. The Blaiklock Glacier group [1983, eng] E-31049

Blaiklock Island
- Geology of the Arrowsmith Peninsula and Blaiklock Island [1984, eng] E-31117

Blue Glacier
- Biota of a lateral moraine and hinterland of the Blue Glacier, South Victoria Land, Antarctica [1985, eng] B-31579

Bonney, Lake
- Sediment features in the drift of Lake Bonney basin, Taylor Valley [1983, eng] E-30234

Bouvet Island
- Prion picture puzzle from the South Atlantic [1983, eng] B-29690
- Ice fish (Chaenichthyidae) in the South Atlantic [1982, ger] B-30155
- Scolex functional morphology of Cestoda from penguins [1982, eng] B-30333
- New contribution to understanding marine Bryozoa in French austral territory [1984, fre] B-31509
- Adventure in the Antarctic [1978, nor] D-30880
- Quantitative evaluation of fractional crystallization in Bouvet Island lavas [1982, eng] E-30319

Bowers Mountains
- Age and correlation of the Cambrian-Ordovician Bowers Supergroup, northern Victoria Land [1983, eng] E-29542

Brabant Island
- Mineral exploration on Antarctic Peninsula [1983, spa] E-29300
- JSE Brabant Island 1983-85 [1984, eng] G-30510

Bransfield Strait
- Distribution of krill in Bransfield Strait [1983, eng] B-29353
- Krill populations in Bransfield Strait [1983, eng] B-29356
- Carbohydrates related to phytoplankton in Bransfield Strait [1984, eng] B-29715
- *Euphausiacea* distribution in Drake Passage and Bransfield Strait [1983, eng] B-30336
- Biomass of krill in the eastern part of Bransfield Strait, March 1981 [1984, eng] B-30782
- Acoustic characterization of krill swarms [1984, eng] B-31194
- Composition of krill schools west of the Antarctic Peninsula [1984, eng] B-31198
- Size frequency pattern of krill in Bransfield Strait [1984, eng] B-31199
- Energy flow through krill swarms [1984, eng] B-31205
- Development and growth in krill larvae [1984, eng] B-31207
- Ammonia excretion in krill during developmental stages [1984, eng] B-31210
- Geographic distribution of macrozooplankton: Bransfield Strait and Scotia Sea [1985, eng] B-31328
- Water masses, bottom topography and krill distribution [1984, eng] B-31697
- Geology of islands in southern Bransfield Strait, Antarctic Peninsula [1984, eng] E-30114
- Thermogenic hydrocarbons in Bransfield Strait sediments [1985, eng] E-31730
- Hydrology of Bransfield Strait and krill distribution [1983, rus] J-29092
- First Post-FIBEX Hydrographic Data Interpretation Workshop [1982, eng] J-29191
- Second Post-FIBEX Hydrographic Data Interpretation Workshop [1983, eng] J-29192
- Characteristics of a salinity front in the eastern Bransfield Strait, the source region of the Weddell-Scotia Confluence [1983, ger] J-31094

Breid Bay
- Activities of the summer party, 24th JARE, 1982-1983 [1984, jpn] D-30621

Brown Station
- Microbiology of Paradise Harbor [1983, spa] B-29135
- Argentine navy personnel saved the life of a British subject in 1958 [1984, spa] G-31248
- Hypophysial function and low temperatures [1983, spa] H-29485

Brunt Ice Shelf
- Volcanic events linked to pH record in Brunt Ice Shelf firn [1983, eng] F-29277
- Survey of the ice shelf edges in the eastern and southern Weddell Sea [1984, eng] F-31156

Bunger Hills
- Bunger Oasis: the largest ice-free area in the Antarctic [1983, eng] E-29491

Byrd Station
- Deformation within polar ice sheets [1983, eng] F-29098
- Data on past air composition from ice cores of Greenland and Byrd Station, Antarctica [1983, eng] F-29234
- Record of past atmospheric CO2 from tree-ring and ice core studies [1983, eng] F-29493
- Mechanics of Byrd Station ice core samples [1974, jpn] F-30359
- Impurities in snow: effects on albedo and snowmelt (review) [1984, eng] F-30484
- Microparticles in ice cores from Antarctica and Greenland [1984, chi] F-30831
- Soluble impurities in the Byrd Station ice core [1985, eng] F-31463

Campbell Island
- New subantarctic species of the lichen genus *Peltularia* [1984, eng] B-30628
- New Zealand sea lion [1981, eng] B-30710
- Glucosephosphate isomerase polymorphism in New Zealand ling *Genypterus blacodes* [1982, eng] B-31186
- Bioassay of some Campbell Island soils [1983, eng] B-31633

Campbell Plateau
- Tidal currents in the Pacific Basin and Campbell Plateau regions [1983, eng] J-29512

Casey Station
- Bottom-ice microalgal community of East Antarctica [1983, eng] B-29497
- Casey site plan, Issue No.4 [1984, eng] C-31378
- Compressed snow-ice airstrip construction in Antarctica [1982, eng] F-29475
- AANBUS: the creation of a building system for Antarctica [1980, eng] G-31335
- Manual for Australian antarctic utilities, bridges, and supports [1982, eng] G-31373
- Halon fire protection system for store buildings [1982, eng] G-31374
- Casey old station site plan, Issue No.2 [1984, eng] G-31377
- Waste disposal at Australian antarctic stations [1984, eng] G-31381
- Rebuilding of Australia's 3 antarctic stations, Parts 1-3 [1983, eng] G-31539
- Support of construction activities during rebuilding of Australia's antarctic stations [1983, eng] G-31540

Clarence Island
- Scotia metamorphic complex at Cape Bowles, Clarence Island [1984, eng] E-29395

Clark Peninsula
- Manganese rich sediments from Wilkes Land [1983, eng] E-29531

Coalsack Bluff
- Geology of Coalsack Bluff [1984, eng] E-30383

Coats Land
- Location and geology of nunataks in north-western Coats Land [1984, eng] E-31116

Commonwealth Bay
- Petrology and geochronology of Herring Island and Commonwealth Bay [1983, eng] E-29530

Cormorant Island
- Rockhopper penguin on Cormorant Island [1982, eng] B-30194

Crary Ice Rise
- Changes in the Ross Ice Shelf dynamic condition [1984, eng] F-29210

Crozet Islands
- Recolonization of Crozet Islands by fur seals [1982, fre] B-28992
- Discovery of French austral and antarctic lands [1983, fre] B-29500
- New contribution to understanding marine Bryozoa in French austral territory [1984, fre] B-31509
- Ecologic comparison and biological peculiarities of Prosobranchia at Crozet and Kerguelen Islands [1984, fre] B-31510
- Volcanology of Possession Island, Crozet Archipelago (TAAF) [1983, eng] E-29640
- Amorphous iron silicates neoformation in recent pelagic sediments [1980, fre] E-30936

Danger Islands
- Geochemistry and age of Danger Islands pluton [1984, eng] E-30458

Daniels Range
- Preliminary report of the geology of Daniels Range [1983, eng] E-29539

Davis Sea
- Seasonal changes in *Polychaeta* of the Davis Sea [1982, rus] B-29242
- Preliminary results of biological studies at Mirnyy Station in the winter 1979 [1984, rus] B-30852
- Reproductive cycle of sea urchin *Sterechinus neumayeri* in Davis Sea [1984, eng] B-31014

Davis Station
- Bottom-ice microalgal community of East Antarctica [1983, eng] B-29497
- Davis site plan, Issue No.4 [1984, eng] C-31380
- Marine geophysical survey, Davis to Mawson Stations [1983, eng] E-29619
- AANBUS: the creation of a building system for Antarctica [1980, eng] G-31335
- Halon fire protection system for store buildings [1982, eng] G-31374
- Waste disposal at Australian antarctic stations [1984, eng] G-31381
- Rebuilding of Australia's 3 antarctic stations, Parts 1-3 [1983, eng] G-31539
- Support of construction activities during rebuilding of Australia's antarctic stations [1983, eng] G-31540
- Pc1-2 discrete regular daytime pulsation bursts at high latitudes [1985, eng] K-31386

Deception Island
- Colonization and recovery by cryptogams on Deception Island [1984, eng] B-29396
- Ecological and chemical investigations of lichens from South Georgia and the maritime Antarctic [1984, eng] B-31574
- Exploitation of geothermal energy in Antarctica [1984, spa] G-31245
- Ionospheric F2 region particle precipitation near South-Atlantic magnetic anomaly [1982, eng] K-30575

Dome C
- Evolutive spectral analysis by autoregressive process of isotopic climatic data from Antarctica [1983, eng] F-30356
- Borehole geometry on the Greenland and Antarctic ice sheets [1985, eng] F-31229
- Isotopic diffusion in cold snow and firn [1985, eng] F-31690
- 30000 yr. climatic record. Main results deduced from oxygen 18 and deuterium profiles from the Dome C ice core (Antarctica) [1981, eng] I-30085
- Climate of Dome C in relation to its geographic setting [1984, eng] I-31455

Don Juan Pond
- Calcite formation in calcium chloride rich water [1984, eng] E-30274
- Hydrogeochemical study of Don Juan Pond [1984, eng] E-30929

Drake Passage
- *Euphausiacea* distribution in Drake Passage and Bransfield Strait [1983, eng] B-30336
- Energy flow through krill swarms [1984, eng] B-31205
- Causes of glaciation of Antarctica [1980, rus] E-29415
- Monitoring ACC transport in Drake Passage [1983, eng] J-29209

Geobarometry, geothermometry and metamorphic evolution of Enderby Land [1983, eng] L-29522
Interpretation of geophysical surveys, Molodezhnaya to Mawson Stations [1983, eng] L-29618
Postglacial isostatic coastal uplift in Enderby Land [1984, ger] L-31224

Erebus, Mount
Seismological observations on Mount Erebus [1983, eng] E-29116
Mount Erebus seismic and volcanic activity, 1981-1982 [1983, eng] E-29117
Origin of salts on Ross Island and Mount Erebus [1983, eng] E-29280
Seismological observation on Mount Erebus, 1980-1981 [1983, eng] E-29642
Volcanic activity and seismicity of Mount Erebus, 1982-1983 [1983, eng] E-30240
Seismic activity in Mount Erebus, 1982-83 [1984, eng] E-30912
Geophysical studies on Mount Erebus [1983, eng] L-30239
Preliminary report of the gravity survey in Ross Island, Antarctica [1984, eng] L-30913
Activities of Japanese earth science research in the McMurdo Sound region in the 1983-1984 season [1984, eng] L-31600

Falkland Islands
Mortality of geese on Falkland Islands [1982, eng] B-29059
Biology of fish around Falkland Islands [1982, eng] B-29284
Age and growth of *Sprattus fuegensis* off Falkland Islands [1982, spa] B-30142
Taxonomy and morphometric and meristic analysis of *Sprattus fuegensis* [1982, spa] B-30143
Extraordinary peat-forming community on the Falkland Islands [1984, eng] B-30420
South American sea lion [1981, eng] B-30711
Feeding of the upland goose and ruddy-headed goose on Falkland Islands [1982, eng] B-31185
Sheld-geese and man in the Falkland Islands [1984, eng] B-31712
Argentine paleontological guide of Permian fauna [1979, spa] E-31225
Ionospheric F2 region particle precipitation near South-Atlantic magnetic anomaly [1982, eng] K-30575

Falla, Mount
Oxygen fugacity in Kirkpatrick basalt on Mount Falla [1984, eng] E-31451

Faraday Station
New ionosonde for the Faraday Station ionospheric laboratory [1984, eng] K-29393

Ferraz Station
Report on the participation in Operation Antarctica 3 [1985, por] A-31629

Filchner Ice Shelf
Anonymous heroes [1982, spa] A-31486
Eggs and larvae of two krill species [1983, eng] B-29342
Geodetic glaciology on Filchner Ice Shelf since 1979/80 [1985, ger] C-31609
Filchner-Ronne Ice Shelf programme, Report 1 (1984) [1985, eng] F-31127
Glaciological studies of the Filchner Ice Shelf, 1983/84 [1984, ger] F-31155
Survey of the ice shelf edges in the eastern and southern Weddell Sea [1984, eng] F-31156
Report of the German engineering glaciology group, 1983/84 [1984, ger] F-31159
Filchner-Ronne Ice Shelf programme, Report 2 (1985) [1985, ger] F-31607
Accumulation on the Filchner/Ronne Ice Shelves [1985, ger] F-31608
Ice core drilling on the Filchner and Ronne Ice Shelves [1985, ger] F-31611
Research activities of West Germany in western Antarctica [1981, ger] F-31678
Satellite observations of ice shelf drift [1984, ger] G-30877
Aerial measurements of glaciological and geophysical parameters in Antarctica [1984, ger] G-31167
Antarctic exploration by airplane [1985, ger] G-31729
Near surface meteorological experiment at the Filchner ice front [1984, ger] I-31169
Are there secondary flows at the edge of the Filchner Ice Shelf [1985, ger] I-31618
Case study of a mesoscale disturbance at Filchner Station [1985, ger] I-31620
Potential effect of CO2 warming on sub-ice-shelf circulation and basal melting [1984, eng] J-31113
Vertical tidal motion of Filchner Ice Shelf [1984, ger] J-31160
Hydrography at the edge of Filchner Ice Shelf [1985, ger] J-31613
Aeromagnetic measurements of the Filchner Ice Shelf and near Georg von Neumayer Station as part of the 1983/84 Filchner Ice Shelf Project [1985, ger] L-31615

Filchner Station
Aerial measurements of glaciological and geophysical parameters in Antarctica [1984, ger] G-31167
Technical concepts of the antarctic stations Georg-Von-Neumayer and Filchner of the Federal Republic of Germany [1983, eng] G-31545
Atmospheric boundary layer changes at Filchner Station [1985, ger] I-31617

Fildes Peninsula
Glaciological and geocryological studies on King George Island [1984, rus] F-30849
Upgrading and moving the Chilean weather transmitter station [1983, eng] G-31516

Fillières Coast
Magnetic and gravity surveys of Graham Land [1983, eng] L-31051

Folger, Cape
Deep ice cores from Antarctica [1974, jpn] F-30367
Relationship between bore hole closure and ice crystal structure [1984, eng] F-31173

Framnes Mountains
Perennially frozen lakes at glacier/rock margins, East Antarctica [1983, eng] E-29608

Fryxell, Lake
Protozoan colonization of artificial substrates in two antarctic lakes [1982, eng] B-29977
Lake sediment chlorophyll a and adenosine triphosphate levels [1983, eng] B-29978

Fyfe Hills
Geology of the Fyfe Hills-Khmara Bay region, Enderby Land [1983, eng] E-29520
Sm-Nd isotopic systematics of Enderby Land granulites [1984, eng] E-31151

Galindez Island
Simple moss-turf communities patterns in South Georgia and Signy Island [1983, eng] B-29675

Gaussberg
Nd and Sr isotope geochemistry of leucite-bearing lavas from Gaussberg, East Antarctica [1983, eng] E-29643

Georg von Neumayer Station
Firn sampling for heavy metals [1983, ger] F-29166
Observatories of the Georg-von-Neumayer Station [1984, eng] G-30211
Aerial measurements of glaciological and geophysical parameters in Antarctica [1984, ger] G-31167
Model tests and in situ behaviour of prestressed anchors in snow and ice [1984, eng] G-31238
Ice plug anchor—development of a new anchor for use in snow and ice [1985, eng] G-31474
Technical concepts of the antarctic stations Georg-Von-Neumayer and Filchner of the Federal Republic of Germany [1983, eng] G-31545
Structure of inversions over the antarctic ice sheet [1983, ger] I-29165
Glaciological trace element investigations at German antarctic stations [1985, ger] I-31612
VLF measurements at GvN Station [1983, ger] K-29168
Aeromagnetic measurements of the Filchner Ice Shelf and near Georg von Neumayer Station as part of the 1983/84 Filchner Ice Shelf Project [1985, ger] L-31615

George V Coast
Marine geology of the George V continental margin: combined results of Deep Freeze 79 and the 1911-14 Australasian Expedition [1983, eng] F-29594

George VI Ice Shelf
Dynamics of George VI Ice Shelf [1983, eng] F-31046
Mass balance of a melting ice shelf [1984, eng] F-31172
Current, temperature and salinity beneath George VI Ice Shelf [1984, eng] J-30860

George VI Sound
Regional Bouguer anomaly map of north-western Palmer Land [1983, eng] L-31050

Gerlache Strait
Aspects of schooling in *Euphausia superba* [1984, eng] B-31196

Gerlache Strait *(cont.)*
Lipid, sterol and fatty acid composition of antarctic krill (*Euphausia superba* Dana) [1984, eng] **B-31444**
Gough Island
Petrels of Antipodes, Prince Edward and Gough Islands [1983, eng] **B-29689**
Hydroacoustic and midwater trawling survey of Gough Island [1982, eng] **B-30168**
Ornithological observations at Gough Island, 1979-1981 [1982, eng] **B-30171**
Bird ringing at Gough Island, 1977-1982 [1983, eng] **B-30841**
Hydrology of water close to Gough Island [1982, eng] **J-30169**
Granite Harbor
Sea floor of McMurdo Sound and Granite Harbor [1983, eng] **E-29391**
Greenwich Island
Landing strip site survey on Greenwich Island [1983, eng] **G-31534**
Hallett, Cape
Census of the South Polar Skua at Cape Hallett, Antarctica [1984, eng] **B-31602**
Hallett Station
Hallett Station, Antarctica, 1956-1973 [1984, eng] **A-29827**
Halley Bay
Analysis of Halley Bay rawinsonde data [1983, eng] **I-29004**
Banded and periodic discrete VLF emissions [1983, eng] **K-29667**
Halley Station
New design concept for Halley Station [1983, eng] **G-31543**
Antarctic research by satellite link [1984, eng] **K-29670**
Sporadic *E(Es)* associated with the main ionospheric trough observed over Halley Station, Antarctica [1984, eng] **K-30112**
Ionospheric F2 region particle precipitation near South-Atlantic magnetic anomaly [1982, eng] **K-30575**
Mid-latitude Pi 2 pulsations, geosynchronous substorm onset signatures and auroral zone currents on March 22, 1979: CDAW 6 [1985, eng] **K-31263**
New VLF method for studying burst precipitation near the plasmapause [1985, eng] **K-31692**
Hart Hills
Geology of Pagano Nunatak and the Hart Hills [1983, eng] **E-29564**
Haswell Islands
Adaptive peculiarities of the breeding cycle of some antarctic birds [1984, rus] **B-31567**
Hays Glacier
Portrait of an antarctic outlet glacier [1983, eng] **F-29048**
Statistical characteristics of variations in the movements of polar ice streams [1982, ger] **F-30157**
Results of geodetic-glaciological work on Hays Glacier [1983, ger] **F-30762**
Heard Island
Inshore fishes of Heard and McDonald Islands [1983, eng] **B-29315**
Volcanic evolution of Heard and McDonald Islands [1983, eng] **E-29636**
Microfossil evidence for the age and environment of deposition of sediments of Heard and McDonald Islands [1983, eng] **E-29637**
Seismic structure of the Kerguelen Ridge [1983, fre] **E-30424**
Paleogene and late Cretaceous pelagic sequence from the Kerguelen-Heard plateau [1983, fre] **J-28993**
Heito Glacier
Distribution of ice crystal c-axes [1974, jpn] **F-30368**
Heritage Range
Low-grade metamorphism in the Heritage Range [1983, eng] **E-29565**
Structural and metamorphic history of the Ellsworth Mountains [1983, eng] **E-29567**
Herring Island
Petrology and geochronology of Herring Island and Commonwealth Bay [1983, eng] **E-29530**
Hoare, Lake
Protozoan colonization of artificial substrates in two antarctic lakes [1982, eng] **B-29977**
Lake sediment chlorophyll *a* and adenosine triphosphate levels [1983, eng] **B-29978**
Antarctic lake heterotrophic community response to high oxygen [1984, eng] **B-30553**
Hobbs Coast
D/E *Gizhiga* operations off Hobbs Coast and organization of the new antarctic station Russkaya [1984, rus] **F-30863**
Hope Bay
Mesozoic conglomerates at Hope Bay [1983, eng] **E-29574**
Horseshoe Island
Geology of Horseshoe and Lagotellerie Islands, Marguerite Bay, Graham Land [1983, eng] **E-31043**
Indian Ocean
Phytoplankton development in the Indian Ocean [1983, rus] **B-29084**
Population of antarctic mass species of copepods in the Lazarev Sea [1983, rus] **B-29086**
Winter distribution of euphausiids in the southwestern Indian Ocean [1983, rus] **B-29087**
Life span of krill derived from population size structure in the Indian Ocean [1983, rus] **B-29093**
Krill biology and distribution in the Lazarev Sea [1983, rus] **B-29094**
FIBEX implementation and coordination [1980, eng] **B-29253**
Chlorophyll *a* in the Antarctic Ocean [1982, eng] **B-29378**
Study of krill early development [1982, eng] **B-29381**
Visual observations of the antarctic sea birds during the FIBEX cruise of the *Kaiyo Maru* [1982, eng] **B-29386**
Benthic foraminifera off Queen Maud Land [1983, eng] **B-29445**
Some observations of the biological productivity of antarctic waters [1983, eng] **B-29457**
Phytoplankton organisms collected during the First Indian Antarctic Expedition [1983, eng] **B-29458**
Zooplankton of the antarctic waters [1983, eng] **B-29459**
Benthic fauna of the antarctic ocean—quantitative aspects [1983, eng] **B-29460**
Biochemical components of the benthic regions in antarctic waters [1983, eng] **B-29461**
Sea birds and marine mammals of the First Indian Antarctic Expedition (1981-82) [1983, eng] **B-29462**
Four new stocks of Lithodids in southwestern Indian Ocean [1982, eng] **B-29710**
History of the regulation of southern minke whaling scientific advice and a response of industry [1981, eng] **B-29751**
Minke whales of the antarctic portion of the Indian Ocean compared with those off Durban [1982, eng] **B-29778**
Mark recapture method for estimation of minke whale population size [1982, eng] **E-29782**
Population distribution of *Arctocephalus tropicalis* and *A. gazella* fur seals [1984, eng] **B-30063**
South African and French collaborative research program on seals from Indian Ocean islands [1984, eng] **B-30068**
Phytoplankton from the southwestern Atlantic and Indian Oceans [1983, eng] **B-30539**
Biomass and caloric studies on marine invertebrates and algae at Kerguelen, southern Indian Ocean [1983, eng] **B-30542**
Diatom distribution in the Indian Ocean [1984, eng] **B-30891**
Nano- and microplankton distribution in the Indian Ocean [1984, eng] **B-30892**
Significance of latitude 55 S to marine mammal distribution [1984, eng] **B-30902**
Early opening between Broken Ridge and Kerguelen Plateau [1983, eng] **E-29032**
Radiolarian distribution in the southeastern Indian Ocean [1978, eng] **E-29847**
Plate motions and aseismic ridges in the Indian Ocean [1984, eng] **E-29972**
Kerguelen hotspot source for Rajmahal Traps and Ninetyeast Ridge [1983, eng] **E-30029**
Mineralogic variability of the uppermost mantle along mid-ocean ridges [1984, eng] **E-30490**
Manganese nodule resources in the Indian Ocean [1980, eng] **E-31407**
Atmospheric circulation over the Indian Ocean [1983, rus] **I-29083**
Turbidity over the Indian Ocean [1983, eng] **I-29268**
Measurements of aerosol particles over the southwestern Indian Ocean [1983, eng] **I-29444**
Geomorphology of the bottom of Indian Ocean [1983, rus] **J-29082**
Effect of vortices on primary productivity [1983, ukr] **J-29203**
Disconformities and paleoceanography in the southeast Indian Ocean during the past 5.4 million years [1983, eng] **J-29313**
Some physical characteristics of the Antarctic and western Indian Oceans [1983, eng] **J-29438**
Chemistry of southwestern portion of Indian Ocean [1983, eng] **J-29440**
Fluoride, bromide and iodide contents in southwestern Indian Ocean [1983, eng] **J-29441**
Calcium, magnesium, sulphate and boron distribution in southwestern Indian Ocean [1983, eng] **J-29442**

Distribution of trace metals in southwestern Indian Ocean ⌈1983, eng⌉ J-29443
New paleoecological evidence in the Indian Ocean for interhemispheric timing of climatic change ⌈1984, eng⌉ J-30268
Carbonate sedimentation beneath the Antarctic Circumpolar Current ⌈1983, eng⌉ J-30520
Dissolution and water mass patterns, SE Indian Ocean ⌈1985, eng⌉ J-31642
Dissolution and water mass patterns, SE Indian Ocean ⌈1985, eng⌉ J-31643
Surface ship gravity meter NIPRORI-1 ⌈1983, eng⌉ L-29979
Further earthquake on the Kerguelen Plateau ⌈1984, eng⌉ L-30750

Ingrid Christensen Coast
Bryoflora of Ingrid Christensen Coast ⌈1984, eng⌉ B-30148

James Ross Island
Stratigraphy of glacigenic deposits on James Ross Island ⌈1983, eng⌉ E-29241

Kemp Coast
Interpretation of geophysical surveys, Molodezhnaya to Mawson Stations ⌈1983, eng⌉ L-29618

Kerguelen Islands
Discovery of French austral and antarctic lands ⌈1983, fre⌉ B-29500
Reproductive biology of *Boccardia polybranchia* (Carazzi) ⌈1984, eng⌉ B-29719
Thymopides grobovi (Decapoda, Crustacea, Nephropidae) off Kerguelen Islands ⌈1979, fre⌉ B-29852
Isopoda and Gnathiida off Kerguelen Islands ⌈1980, eng⌉ B-29853
Rotifer fauna and population dynamics of Lake Studer 2, Kerguelen Archipelago ⌈1984, eng⌉ B-29932
Population biology of the elephant seal at Kerguelen Islands ⌈1984, eng⌉ B-30067
Karyotype of *Aulacomya ater regia* (Mollusca: Bivalvia: Mytilidae) from the Kerguelen Islands ⌈1984, eng⌉ B-30077
Breeding population of elephant seal at Kerguelen ⌈1982, eng⌉ B-30167
Biomass and caloric studies on marine invertebrates and algae at Kerguelen, southern Indian Ocean ⌈1983, eng⌉ B-30542
Photosynthesis and respiration in the sub-antarctic tussock grass *Poa cookii* ⌈1983, eng⌉ B-30627
Evolution of genetic variability between and within populations of Salmonidae derived from the same gene pools ⌈1984, fre⌉ B-31126
Chromosome analysis of three species of *Mytilus* (Bivalvia: Mytilidae) ⌈1984, eng⌉ B-31456
Descriptive data on the Annelid macrobenthos in Morbihan Bay, Kerguelen ⌈1984, fre⌉ B-31508
New contribution to understanding marine Bryozoa in French austral territory ⌈1984, fre⌉ B-31509
Ecologic comparison and biological peculiarities of Prosobranchia at Crozet and Kerguelen Islands ⌈1984, fre⌉ B-31510
Sinking rates of subantarctic neritic phytoplankton ⌈1984, fre⌉ B-31704
Monoraphidinae diatoms in the Kerguelen Islands ⌈1983, fre⌉ B-31713
Ecophysiology of a planktonic crustacean from Kerguelen ⌈1983, eng⌉ B-31748
Comparison of respiration in marine worms ⌈1983, eng⌉ B-31752
Genetic variations in Kerguelen benthic invertebrates ⌈1983, eng⌉ B-31753
Volcanic activity in the Kerguelen Islands ⌈1983, eng⌉ E-29638
Study of Kerguelen plutonism: petrology, geochronology and geological implications ⌈1983, eng⌉ E-29639
Marine intraplate plutonism: example of Kerguelen Islands ⌈1983, fre⌉ E-29964
Infrared survey of geothermal fields in Kerguelen Archipelago ⌈1984, eng⌉ E-29971
Errors in K-Ar dating of altered rocks ⌈1983, eng⌉ E-30021
Seismic structure of the Kerguelen Ridge ⌈1983, fre⌉ E-30424
Environmental implications of periglacial features on Marion and Kerguelen ⌈1983, eng⌉ E-30838
Sources of oceanic basalts: Radiogenic isotopic evidence ⌈1985, eng⌉ E-31404
Temperature profiles in the stratosphere and mesosphere ⌈1985, rus⌉ I-31652
Paleogene and late Cretaceous pelagic sequence from the Kerguelen-Heard plateau ⌈1983, fre⌉ J-28993

King George Island *(cont.)*
Polish 2nd Antarctic Expedition oceanographic study of Ezcurra Inlet [1980, eng] J-29283
King Haakon Bay
Research on the Ross seal, *Ommatophoca rossii*, in the King Haakon VII Sea, Antarctica [1984, eng] B-30066
Komsomolskaya Station
Test drilling at Komsomolskaya Station [1983, rus] F-29739
Kraul Mountains
Geological expedition to the Kraul Mountains [1983, ger] E-29163
La Gorce Mountains
Type locality of the Ackerman Formation, La Gorce Mountains [1983, eng] E-29550
Lagotellerie Island
Geology of Horseshoe and Lagotellerie Islands, Marguerite Bay, Graham Land [1983, eng] E-31043
Lambert Glacier
Chemical composition of Amery lakes [1982, rus] E-28974
Langhovde Hills
Geomorphological map of Langhovde Hills [1984, eng] C-30566
Langhovde-kita Point
Unconsolidated deposits in the Langhovde and Skarvsnes areas [1983, eng] F-29128
Lassiter Coast
Ice sheet thickness on Lassiter Coast [1983, eng] E-30393
Organic substance distribution in Lassiter Coast rocks [1984, rus] E-30865
Law Dome
Deep ice cores from Antarctica [1974, jpn] F-30367
Compacted snow as a pavement material for runway construction [1984, eng] F-30577
Studies of ice formation and ice fabric on the Law Dome, Antarctica [1984, chi] F-30830
Lazarev Bay
Environment and adaptation of krill in the Lazarev Sea [1985, rus] B-31665
Lazarev Station
Freezing of sea water in shelf glaciers [1962, rus] F-30323
Lützow-Holm Bay
Stomach contents in fish from Lützow-Holm Bay [1982, eng] B-29384
Ice algae in Lützow-Holm Bay [1984, eng] B-30123
Seasonal change of chlorophyll *a* in Lützow-Holm Bay [1984, eng] B-30893
Distribution of carnivorous invertebrates in Lützow-Holm Bay [1984, eng] B-30899
Culture of *Phyllophora antarctica* [1984, eng] B-30900
Aluminum silicates in the Prince Olav Coast and Showa region [1983, eng] E-29121
Geomorphology at Lützow-Holm Bay [1983, eng] E-29122
Foraminifera from raised beach deposits, Lützow-Holm Bay [1983, eng] E-29127
Significance for Gondwanaland of tectonics in Lützow-Holm Bay [1983, eng] E-29524
Tectonic and metamorphic history of Lützow-Holm Bay [1983, eng] E-29526
Seismic profiles of Amundsen and Lützow-Holm Bays, 1982 [1984, eng] E-30915
Geology of islands west of Langhovde [1984, eng] E-30921
Heat flow measurements in Lützow-Holm Bay, Antarctica [1983, eng] J-29113
Submarine topography of Lützow-Holm Bay, Antarctica [1983, eng] J-29130
Heat flow measurements in Lützow-Holm Bay [1983, eng] J-29616
Geophysical investigation of eastern Lützow-Holm Bay [1983, eng] L-29617
Gravity survey in East Antarctica [1984, eng] L-29929
Mac. Robertson Land
Chemical composition of Amery lakes [1982, rus] E-28974
Geological structure of Mac. Robertson Land (East Antarctica) [1984, eng] E-30799
Interpretation of geophysical surveys, Molodezhnaya to Mawson Stations [1983, eng] L-29618
Macquarie Island
Fertilisation of Wandering Albatross eggs on Macquarie Island [1983, eng] B-29096
Rabbits, vegetation and erosion on Macquarie Island [1983, eng] B-29323
Leopard seals at Macquarie Island, 1949-1979 [1980, eng] B-29824
Annotated atlas of the vascular flora of Macquarie Island [1984, eng] B-30154
Second record of spectacled porpoise from subantarctic southwest Pacific [1984, eng] B-30276
Epididymal annual cycle in elephant seal at Macquarie Island [1984, eng] B-30302
Weka on Macquarie Island [1984, eng] B-30506
Morphology of Wandering Albatrosses on Macquarie Island [1984, eng] B-30507
New subantarctic species of the lichen genus *Peltularia* [1984, eng] B-30628
New Zealand sea lion [1981, eng] B-30710
Breeding distribution of the Brown Skua on Macquarie Island [1984, eng] B-31321
Breeding, distribution and status of burrow-nesting petrels at Macquarie Island [1984, eng] B-31500
Mass stranding of squid at Macquarie Island [1983, eng] B-31756
Geology of Macquarie Island [1984, eng] E-31369
Macquarie Island, a wind-formed natural landscape in the Subantarctic [1983, ger] I-29105
Onset time interval of geomagnetic disturbances in the conjugate areas [1984, eng] K-31385
Macquarie Ridge
Magmatic rocks from the Macquarie Ridge, southwestern Pacific [1979, rus] E-29216
Macquarie Rise
Deep-sea drilling in the roaring 40's [1973, eng] E-29903
Marie Byrd Land
Petrology of Marie Byrd Land and Victoria Land [1983, eng] E-29569
Record of ice levels contained in volcanic rocks of Marie Byrd Land [1983, eng] E-29641
Isotopic studies on continental alkali basalts from Marie Byrd Land [1983, eng] E-29799
Reconnaissance of hyaloclastites in the western Ross Sea region [1983, eng] E-30249
Marion Island
Diving depths of the Gentoo penguin [1983, eng] B-29150
Haul-out patterns of fur seals on Marion Island [1983, eng] B-29515
Full rearing of twin pups by a female fur seal [1983, eng] B-29516
Breeding population of southern elephant seals, Marion Island [1983, eng] B-29912
Elephant seal population at Marion Island in 1973-1983 [1984, eng] B-30062
Moulting sites of southern elephant seals on Marion Island [1984, eng] B-30065
Chlorinated pesticides in cats on Marion Island [1984, eng] B-30070
Metabolic rate in the Wandering Albatross [1984, eng] B-30093
Nitrogen pathway in a penguin rookery [1984, eng] B-30121
Feeding ecology of the house mouse *Mus musculus* on Marion Island [1982, eng] B-30170
Bird ringing at Marion and Prince Edward Islands, 1977-1982 [1982, eng] B-30172
Territoriality in lesser sheathbills on Marion Island [1984, eng] B-30556
Resting metabolism and energetic cost of incubation in macaroni and rockhopper penguins [1984, eng] B-30585
Photosynthesis and respiration in the sub-antarctic tussock grass *Poa cookii* [1983, eng] B-30627
Predation of an insect larva on Marion Island [1983, eng] B-30840
Acetylene reduction by cyanobacteria epiphytic on moss at Marion Island [1984, eng] B-31055
Utilization of a squid diet by adult King penguins [1984, eng] B-31096
Feeding ecology of three Marion Island fish species [1982, eng] B-31425
Marine food of the birds of Marion Island [1981, eng] B-31459
Problematical petrographic successions on Marion Island [1983, eng] E-30835
Environmental implications of periglacial features on Marion and Kerguelen [1983, eng] E-30838
Reconstruction of the Quaternary ice cover on Marion Island [1983, eng] I-29606
Mawson Station
Bottom-ice microalgal community of East Antarctica [1983, eng] B-29497
Mawson site plan, Issue No.3 [1984, eng] C-31379
Marine geophysical survey, Davis to Mawson Stations [1983, eng] E-29619

AANBUS: the creation of a building system for Antarctica [1980, eng] G-31335
Halon fire protection system for store buildings [1982, eng] G-31374
Mawson bulk fuel system [1982, eng] G-31375
Waste disposal at Australian antarctic stations [1984, eng] G-31381
Rebuilding of Australia's 3 antarctic stations, Parts 1-3 [1983, eng] G-31539
Support of construction activities during rebuilding of Australia's antarctic stations [1983, eng] G-31540
Hydroxyl rotational temperature measurements [1983, eng] K-28998

McDonald Islands
Inshore fishes of Heard and McDonald Islands [1983, eng] B-29315
Volcanic evolution of Heard and McDonald Islands [1983, eng] E-29636
Microfossil evidence for the age and environment of deposition of sediments of Heard and McDonald Islands [1983, eng] E-29637

McIntyre Island
Surinamite, taaffeite, and beryllian sapphirine from McIntyre Island [1981, eng] E-31497

McMurdo Ice Shelf
Liquid conductivity of a 44-meter firn core, McMurdo Ice Shelf [1983, eng] F-30399

McMurdo Sound
Survival of weddell seal pups to weaning [1983, eng] B-29213
Diel haul-out patterns of Weddell seals [1983, eng] B-29214
Underwater vocalizations of Weddell seals [1983, eng] B-29215
Biology and ecology of a scallop in McMurdo Sound [1983, eng] B-29465
Benthic foraminifera of McMurdo Sound [1983, eng] B-29595
Weddell seal vocalizations responding to underwater playbacks [1983, eng] B-29721
Comparison of marine soft-bottom communities in California and Antarctica [1980, eng] B-29807
Physical mechanism for establishing algal populations in frazil ice [1983, eng] B-29968
Influence of light on development and growth of sea-ice microbial communities in McMurdo Sound [1983, eng] B-30535
Distribution, abundance, and diversity of McMurdo Sound ice bacteria in 1980 [1984, eng] B-30554
Microprocessor-controlled monitoring of bradycardia in free-diving Weddell seals [1983, eng] B-30686
Ecology of Weddell seals in McMurdo Sound 1982-1983 [1983, eng] B-30687
Age determination and growth of fish from McMurdo Sound [1984, eng] B-30824
Fossil and recent Bryozoa from the Ross Sea [1984, eng] B-30832
Bacterial plasmids in antarctic natural microbial assemblages [1984, eng] B-31054
Sea ice microbial communities. 3. Seasonal abundance of microalgae and associated bacteria, McMurdo Sound, Antarctica [1984, eng] B-31714
Sea ice microbial communities. 4. The effect of light perturbation on microalgae at the ice-seawater interface in McMurdo Sound, Antarctica [1985, eng] B-31715
Sea floor of McMurdo Sound and Granite Harbor [1983, eng] E-29391
Modern sedimentation in McMurdo Sound [1983, eng] E-29623
Japanese activities at McMurdo Sound during 1981-1982 season [1984, eng] E-30129
Dry valleys/McMurdo Sound magnetostratigraphy and sedimentology [1983, eng] E-30235
Deep seismic soundings along the boundary between East and West Antarctica [1983, eng] E-30236
Revision of ages of Cenozoic erratics at Mount Discovery and Minna Bluff [1983, eng] E-30238
Reconnaissance geological investigation of basement units, McMurdo Sound region [1983, eng] E-30242
Paleomagnetism in McMurdo Sound [1984, eng] E-30477
Submarine ice cliffs in McMurdo Sound [1983, eng] F-29076
Evolution of McMurdo Sound mountain glaciers [1980, rus] F-29420
Origin of McMurdo Sound glaciers from oxygen-isotopic ice analysis data [1980, rus] F-29422
Stable isotope analysis of a submarine ice cliff at Explorers Cove, McMurdo Sound, Antarctica [1984, eng] F-30488
Portable shelter for use in collecting sea bottom sediments [1983, eng] G-31538
Oceanography of the antarctic marginal ice zone [1983, eng] J-30541
Crust and upper mantle study of McMurdo Sound [1983, eng] L-29556
Activities of Japanese earth science research in the McMurdo Sound region in the 1983-1984 season [1984, eng] L-31600

McMurdo Station
Unveiling the secrets of the ice continent [1984, rus] A-31061
Renal and hepatic physiology in diving Weddell seals [1983, eng] B-29499
Properties of antifreeze proteins from fish blood and penguin egg-white proteins [1983, eng] B-30682
History of the McMurdo nuclear power plant [1982, eng] G-29708
INMARSAT: a new communication system for McMurdo Station [1984, eng] G-30565
Operational weather forecasting using weather satellite imagery in Antarctica [1983, eng] G-31515
Colds in persons emerging from isolation compared to newly arrived persons [1983, eng] H-30696
Atmospheric processes over western Antarctica [1980, rus] I-29429
Antarctic hydroxyl radical measurements [1983, eng] I-30701
Meteorological and aerosol experiments in Antarctica [1983, eng] I-30703
Aerosols in the antarctic stratosphere after El Chichon eruption [1985, eng] I-31403
Measurement of ionospheric electron columnar content changes over McMurdo Station [1983, eng] K-30709

Melbourne, Mount
Volcanic activity of Mount Melbourne, Northern Victoria Land [1983, eng] E-30225

Mesa Range
Major and trace element geochemistry of the Kirkpatrick Basalt, Mesa Range [1985, eng] E-31319

Mirnyy Station
Unveiling the secrets of the ice continent [1984, rus] A-31061
Preliminary results of biological studies at Mirnyy Station in the winter 1979 [1984, rus] B-30852
Antarctic ice berths [1984, rus] F-30867
Bearing strength of fast ice and antarctic transport operations during the spring-summer period [1979, eng] F-31060
Use of snow airfields in Antarctica for determination of accumulation rate and atmospheric precipitation [1985, rus] F-31660
Inorganic substance content in atmospheric precipitation at Mirnyy Station [1984, rus] I-30872
Possibility of classification of photometric records at the polar cap [1984, eng] K-30633
Behavior of plasma sheet during breakup according to Mirnyy Station data [1984, eng] K-30634

Mizuho Plateau
Summer snow crystal shapes on Mizuho Plateau [1983, eng] F-29271
Snow densification on Mizuho Plateau [1983, eng] F-29275
Amplitude of seismic waves in east antarctic ice sheets [1984, eng] F-30102
Climate of the interior of Mizuho Plateau [1983, eng] I-29263
Crustal structure of Mizuho Plateau [1983, eng] L-29615
Gravity survey in East Antarctica [1984, eng] L-29929

Mizuho Station
Japanese antarctic research, 1984 report [1984, eng] A-31011
Ice sheet flow velocity, Showa to Mizuho Stations [1983, eng] F-29131
Data problems with heat flux in surface snow at Mizuho Station [1983, eng] F-29266
Power spectral analysis of snow densities at Mizuho Station [1983, eng] F-29276
Snow storm with strong wind in Antarctica [1983, jpn] F-29962
Station position, elevation and ice thickness between Syowa and Mizuho stations [1984, eng] F-30041
Sonic wave velocities and ice core structure [1974, jpn] F-30361
Snow structure and thermal conductivity at Mizuho [1974, jpn] F-30364
POLEX-South data, Part 5, 1981 [1983, eng] I-29195
Meteorological data at Mizuho Station, Antarctica, 1982 [1983, eng] I-29196
Climatological features of Mizuho Station [1983, eng] I-29261
Extremely low air temperature at Mizuho Station [1983, eng] I-29262
Atmospheric boundary layer at Mizuho Station [1983, eng] I-29264
Modeling strong katabatic winds at Showa and Mizuho Stations [1983, eng] I-29265
Solar radiation and snow albedo at Mizuho Station [1983, eng] I-30351
Longwave radiation balance under strong surface inversion in the katabatic wind zone, Antarctica [1984, eng] I-31076

Mizuho Station *(cont.)*

- Report of the 1983 conjugate campaign in Iceland [1984, eng] K-30130
- Harmonic structure of Pc 3-5 magnetic pulsations [1984, eng] K-30350

Pensacola Mountains

- Skua and petrel sightings in the Thiel and southern Pensacola Mountains [1983, eng] B-30689
- Age of folded rocks of Pensacola Mountains (West Antarctica) [1984, rus] E-30864

Port Lockroy Station

- Argentine navy personnel saved the life of a British subject in 1958 [1984, spa] G-31248

Pourquoi Pas Island

- Geology of Pourquoi Pas Island [1983, eng] E-31036

Prince Charles Mountains

- Relief and glaciation of the southern portion of Prince Charles Mountains [1980, rus] E-29425
- Early glacial deposits in the Prince Charles Mountains [1985, rus] E-31658

Prince Edward Islands

- Petrels of Antipodes, Prince Edward and Gough Islands [1983, eng] B-29689
- Interbreeding populations of fur seals at Prince Edward Islands [1984, eng] B-30064
- Hydroacoustic and midwater trawling survey of Prince Edward Islands [1982, eng] B-30166
- Bird ringing at Marion and Prince Edward Islands, 1977-1[illegible]982, eng] B-30172
- Population sizes and trends of fur seals on Prince Edward Islands [1983, eng] B-31424

Prince Harald Coast

- Japanese geomorphological research in the Lützow-Holm Bay region [1984, jpn] E-31396

Prince Olav Coast
Adélie penguin census in 1981-1983 breeding seasons near Showa Station [1984, eng] **B-30901**
Geology and petrology of Prince Olav Coast [1983, eng] **E-29523**
Explanatory text and geological map of Akarui Point and Naga-iwa Rock [1984, eng] **E-30132**
Explanatory text and geological map of Kasumi Rock, Antarctica [1984, eng] **E-30133**
Orthopyroxene-bearing rocks from Prince Olav Coast [1984, eng] **E-30919**
Metapelites in the Cape Omega area [1984, eng] **E-30920**
Japanese geomorphological research in the Lützow-Holm Bay region [1984, jpn] **E-31396**
Upper crustal structure of the Prince Olav Coast, East Antarctica [1984, eng] **F-30099**
Seismic velocity of the ice sheet on Prince Olav Coast [1984, eng] **F-30101**
Amplitude of seismic waves in east antarctic ice sheets [1984, eng] **F-30102**
Princess Elizabeth Land
Archaean and Late Proterozoic rocks on Princess Elizabeth Land [1982, eng] **E-31012**
Provender, Mount
Radiocarbon dating of breeding places of petrels in the Antarctic [1984, eng] **B-30456**
Prydz Bay
Specimen of rare fish caught in Prydz Bay [1981, eng] **B-29837**
Prydz Bay phytoplankton, Feb. 1969 [1983, eng] **B-30337**
Copepoda (Calanoida) from Prydz Bay [1983, eng] **B-30338**
Food of Antarctic Petrels *(Thalassoica antarctica)* [1984, eng] **B-31320**
Water masses and circulation in the region of Prydz Bay, Antarctica [1984, eng] **J-30861**
Queen Fabiola Mountains
Syenitic rocks from the Queen Fabiola Mountains [1983, eng] **E-29125**
Geology and petrology of the Yamato Mountains [1983, eng] **E-29527**
Geology of the Minami-Yamato Nunataks [1984, eng] **E-30922**
Ice thickness on cirque glaciers in the Yamato Mountains [1984, eng] **F-30910**
Queen Maud Land
Earth scientists visit Antarctic [1984, eng] **A-30199**
Summer in the Antarctic among penguins, seals and whaling relics [1983, nor] **A-30546**
Biological studies on the ice shelf and in freshwater lakes of Queen Maud Land [1983, eng] **B-29456**
Supercooling and winter survival in terrestrial arthropods [1982, eng] **B-29955**
Breeding sites of snow petrels in Queen Maud Land [1983, eng] **B-30843**
Adventure in the Antarctic [1978, nor] **D-30880**
Study of sediments on and off Queen Maud Land coast [1983, eng] **E-29446**
Geomorphologic, seismic and magnetic study of the coast of Queen Maud Land [1983, eng] **E-29454**
Isotope analysis of intrusive rocks in Queen Maud Land [1983, eng] **E-29529**
Explanatory text and locality map of Yamato-69, Yamato-73, Yamato-74 and Yamato-75 meteorites [1983, eng] **E-30134**
Bubble close-off density of antarctic ice [1983, eng] **F-29274**
Chemical studies of sea and fresh water on the coast of Queen Maud Land [1983, eng] **F-29439**
Glaciological research program in East Queen Maud Land, 1982-1983 [1984, eng] **F-30040**
Tritium in antarctic precipitation—information on global distribution [1984, eng] **F-30450**
Glacial geomorphology between Breid Bay and Sör Rondane Mountains, Queen Maud Land [1984, eng] **F-31594**
Bathymetry and geomorphology of the coast of Queen Maud Land [1983, eng] **J-29451**
Queen Maud Mountains
Large thecodont reptiles from the Fremouw Formation [1983, eng] **E-30245**
Reunion Island
Bathyal crabs from Reunion Island: Description of *Cyrtomaia guillei* sp. nov., *:Platypilumnus inermis* sp. nov., and *Psopheticus vocans* sp. nov. (Crustacea Decapoda Brachyura) [1984, fre] **B-31504**
Cruise MD 32 of the *Marion Dufresne* to Reunion Island. Portunidae (Crustacea Decapoda Brachyura) [1984, fre] **B-31505**
Notes on stomatopod crustacea from La Réunion and Mauritius [1984, eng] **B-31506**
Riiser-Larsen Ice Shelf
Chemical composition of snow at the Riiser-Larsen Ice Shelf [1984, eng] **F-30715**
Survey of the ice shelf edges in the eastern and southern Weddell Sea [1984, eng] **F-31156**
Riiser-Larsen, Mount
Landforms of Mount Riiser-Larsen, Amundsen Bay [1983, eng] **E-29129**
Archean granulites from Mt. Riiser-Larsen, Enderby Land [1984, eng] **E-30918**
Robertson Bay
Sedimentology of Robertson Bay [1983, eng] **E-29537**
Tectonics of the deformations of Robertson Bay Group [1983, eng] **E-29538**
Youngest Cambrian or oldest Ordovician fossils from Robertson Bay [1984, eng] **E-30427**
Ronne Ice Shelf
Filchner-Ronne Ice Shelf programme, Report 1 (1984) [1985, eng] **F-31127**
Filchner-Ronne Ice Shelf programme, Report 2 (1985) [1985, ger] **F-31607**
Accumulation on the Filchner/Ronne Ice Shelves [1985, ger] **F-31608**
Ice core drilling on the Filchner and Ronne Ice Shelves [1985, ger] **F-31611**
Satellite observations of ice shelf drift [1984, ger] **G-30877**
Potential effect of CO2 warming on sub-ice-shelf circulation and basal melting [1984, eng] **J-31113**
Ross Ice Shelf
Shackleton's antarctic writings [1983, eng] **A-30752**
Nitrogen distribution in marine environment by phytoplankton and bacteria [1982, eng] **B-30308**
Sedimentation in the Ross Sea [1983, eng] **E-29622**
Revised history of glacial sedimentation in the Ross Sea region [1983, eng] **E-29624**
Occurrence of *Pseudammodochium* from the subbottom sediments of the Ross Ice Shelf [1983, eng] **E-30528**
Changes in the Ross Ice Shelf dynamic condition [1984, eng] **F-29210**
Ultrasound investigations of Ross Ice Shelf bottom [1983, rus] **F-29729**
Modified theory of bottom crevasses [1984, eng] **F-29742**
Radar investigations of the Ross Ice Shelf [1980, eng] **F-29806**
Analysis of gravity measurements on the Ross Ice Shelf, Antarctica [1982, eng] **F-29894**
Studying ice cores from the Ross Ice Shelf [1983, rus] **F-29938**
West antarctic ice sheet: diagnosis and prognosis [1983, eng] **F-29973**
Ross Ice Shelf oxygen isotope profile at J-9 [1983, eng] **F-30400**
Model of interactions between ice stream, ocean and solid ground in West Antarctica [1983, eng] **F-30437**
A three-dimensional time-dependent model of the West Antarctic ice sheet [1984, eng] **F-30479**
Interactions between polar ice streams and the sea [1984, eng] **F-30503**
Origin of "inundated shore lines" of glaciated North Atlantic shelves [1982, rus] **F-30744**
Rheology of glacier ice [1985, eng] **F-31285**
Because a large part of the inland ice in West Antarctica lies on a bed far below sea level, the ice sheet is theoretically capable of an unstable and rapid shrinkage. [1983, eng] **F-31427**
Interactions between ice shelves and earth [1985, eng] **F-31462**
Not a search for kiwi bird [1984, rus] **F-31625**
Chemistry of precipitation in relation to precipitation type [1982, eng] **I-30429**
Study of antarctic remote site automatic weather station data (1980-81) from the Ross Ice Shelf area [1984, eng] **I-31099**
Thermohaline circulation below the Ross Ice Shelf [1984, eng] **J-29227**
Thermal conditions under the Ross Ice Shelf [1980, rus] **J-29428**
Sea and ocean level fluctuations for 15,000 years [1982, rus] **J-30741**
Potential effect of CO2 warming on sub-ice-shelf circulation and basal melting [1984, eng] **J-31113**
Analysis of geophysical data from Dome C and the Ross Ice Shelf [1983, eng] **L-30398**

Ross Island
Note on the feeding behavior of the Adélie penguin [1983, jpn] B-29408
Algal taxonomy and ecology on Mt. Erebus [1984, eng] B-31367
Origin of salts on Ross Island and Mount Erebus [1983, eng] E-29280
Field test of thermoluminescence dosimeters on Ross I. [1983, eng] E-30241
Campanian palynomorphs from Ross and Vega Islands, Antarctic Peninsula [1983, eng] E-30251
Ammonite zonation of mid-Cretaceous rocks of Ross Island [1984, eng] E-30466
Antarctic automatic weather stations as forecasting aids [1983, eng] I-30971

Ross Sea
Antifreeze glycopeptides of antarctic fishes [1983, eng] B-29328
Gyrinomimus notius sp.n. first finding in Ross Sea [1983, rus] B-29685
Taxonomy and morphology of a Ross Sea crustacean [1983, eng] B-29923
Penguins of the Ross Sea region [1984, eng] B-30580
Photoadaptation in marine phytoplankton [1984, eng] B-31490
Plankton in the ice of the Ross Sea [1985, eng] B-31735
Shore types of Victoria Land, Ross Dependency, Antarctica [1984, eng] C-30151
Ross Sea Oligocene-Miocene glacial record [1983, eng] E-29237
Sedimentary basins of the Ross Sea [1983, eng] E-29620
Revised history of glacial sedimentation in the Ross Sea region [1983, eng] E-29624
Analysis of southern ocean rocks of the *Eltanin* collection [1983, eng] E-29668
Investigations of the antarctic continental margin, 1984 [1984, eng] E-29860
Leg 28 deep-sea drilling in the southern ocean [1973, eng] E-29902
Sedimentation on the Ross Sea continental shelf, Antarctica [1984, eng] E-30146
Hydrocarbon exploration of Ross Sea basins from geophysical data modelling [1984, eng] E-30177
Reconnaissance of hyaloclastites in the western Ross Sea region [1983, eng] E-30249
Surface roughness of Ross Sea pack ice [1983, eng] F-30410
Iceberg quantities, shapes, and sizes in western Ross and D'Urville Seas [1983, eng] F-30513
West antarctic sea ice [1984, eng] F-31106
Air-sea interactions over the Ross Sea in the surface boundary layer [1983, eng] I-30700
Numerical simulations of the Ross Sea tides [1984, eng] J-29228
Ross Sea heat flux experiment field activities [1983, eng] J-30516

Russkaya Station
D/E *Gizhiga* operations off Hobbs Coast and organization of the new antarctic station Russkaya [1984, rus] F-30863

Saint Paul Island
Discovery of French austral and antarctic lands [1983, fre] B-29500
Garganey on St. Paul and Amsterdam Islands [1983, eng] B-30591

Schirmacher Ponds
Skuas at the Schirmacher Ponds [1983, ger] B-30766
Biogenic elements in Schirmacher Ponds in natural conditions and following human activities [1984, rus] B-30851
Hydrographic chart of the Schirmacher Ponds region [1983, ger] C-30764
Deuterium and 0-18 variations in Schirmacher Ponds [1983, eng] E-29202
Physical geography in the Schirmacher region [1984, eng] E-30451
Hydrology and hydrochemistry of Schirmacher Ponds [1984, eng] E-30453
K-Ar dating of basalt dykes at the Schirmacher Ponds [1984, eng] E-30457
Geology of the Schirmacher Ponds region [1983, ger] E-30765
Isotope variations in flora from the Schirmacher Ponds region [1984, rus] E-30871
Laboratory base for geophysical observations [1983, eng] G-31547
Deuterium as related to water vapor and precipitation at Schirmacher Ponds [1984, eng] I-30452
Isotope distribution and glaciology of the Schirmacher Ponds region [1984, eng] I-30455
Qualitative interpretation of magnetic measurements near Schirmacher Ponds [1983, ger] L-30757

Scotia Sea
Ontogenetic migration of antarctic Euphausiids [1982, rus] B-28977
New species and a new subspecies of *Paraliparis* (Liparidae) from western Antarctica, Pt.2 [1982, eng] B-29029
Energy metabolism and nutrition in marbled notothenia [1982, eng] B-29030
Bathylagus antarcticus roe—characteristics and distribution [1982, eng] B-29031
Krill in the Scotia Sea [1983, rus] B-29091
Atlas of Fish Larvae of the Southern Ocean [1983, eng] B-29245
FIBEX implementation and coordination [1980, eng] B-29253
Amphipoda from the Southern Ocean [1983, eng] B-29321
Eggs and larvae of two krill species [1983, eng] B-29342
Scopelosaurus hamiltoni (Notosudidae) in the Scotia Sea [1981, eng] B-29688
Muraenolepidae eggs and larvae from the Scotia Sea [1983, eng] B-29879
Mixed waters of the secondary front zone of Scotia Sea and krill distribution [1984, eng] B-29943
Hydrochemical conditions in areas of krill concentrations in Scotia Sea and the South Pacific [1984, eng] B-29946
Population composition of krill *Euphausia superba* Dana [1984, eng] B-29947
Regional studies of daily, seasonal and size fraction variability in ammonium remineralization [1982, eng] B-30017
Distribution and feeding of *Electrona carlsbergi* Tåning (Myctophidae) in the Scotia Sea [1981, rus] B-30322
Fish distribution in Scotia Sea and off the Antarctic Peninsula [1983, eng] B-30339
Superswarms of antarctic krill *(Euphausia superba* Dana) [1983, eng] B-30674
Antarctic krill *(Euphausia superba)* swarms from Elephant Island [1983, eng] B-30675
Zooplankton associated with superswarms of antarctic krill [1983, eng] B-30676
Larvae of the family Nototheniidae from the Scotia Sea [1984, eng] B-31052
Structures of swarming and dispersed krill populations [1984, eng] B-31195
Feeding requirements of krill in relation to food sources [1984, eng] B-31202
Development and growth in krill larvae [1984, eng] B-31207
Vertical distribution of krill larvae in the Scotia Sea [1984, eng] B-31208
Geographic distribution of macrozooplankton: Bransfield Strait and Scotia Sea [1985, eng] B-31328
Lipid, sterol and fatty acid composition of antarctic krill *(Euphausia superba* Dana) [1984, eng] B-31444
Photoadaptation in marine phytoplankton [1984, eng] B-31490
Reestablishment of the validity of *Lampris immaculata* Gilchrist and the geographical distribution of Lampridae [1983, eng] B-31570
Krill food supply and phytophaga in Scotia Sea [1985, rus] B-31666
Postlarval notothenioids [1984, eng] B-31698
Geological history of the Scotia Arc and the Antarctic Peninsula [1979, spa] E-28995
Evolution of the Scotia Arc: a review [1983, eng] E-29570
Analysis of southern ocean rocks of the *Eltanin* collection [1983, eng] E-29668
Plate tectonics of the Scotia Sea region [1970, eng] E-31473
Magnetic properties of igneous rocks from the ocean floor [1971, eng] E-31736
Nonlinear model of mesoscale ocean circulation [1983, rus] J-29503
Physical oceanography of the eastern Scotia Sea [1984, eng] J-30596
Oceanographic structure of the eastern Scotia Sea—2. Chemical oceanography [1984, eng] J-30862
Characteristics of a salinity front in the eastern Bransfield Strait, the source region of the Weddell-Scotia Confluence [1983, ger] J-31094

Scott Island
Geology of Scott and Balleny Islands [1982, eng] E-29669

Scott Station
New Zealand antarctic research report to SCAR No.26, 1984 [1984, eng] A-31010
Reconstruction of Scott Base [1983, eng] G-29392
Movement of resupply cargo to Scott Base by container [1983, eng] G-31537
Fire equipment—sprinkler system [1983, eng] G-31550
Reverse osmosis hyperfiltration water plant installation, Scott Base [1983, eng] G-31551
Springtime stratosphere NO2 in Antarctica [1984, eng] I-29909
Temperature record of Scott Base, Antarctica [1984, eng] I-30079
Summer circulation in middle atmosphere [1984, eng] I-30265

Seal Nunataks
Seal Nunataks: an active volcanic group on Larsen Ice Shelf [1983, eng] E-29580

Seymour Island
Cenozoic high latitude heterochroneity of Southern Hemisphere marine faunas [1984, eng] B-30072
Elasmosaurus (Reptilia, Plesiosauria) of the Upper Cretaceous in the Antarctic [1984, eng] B-31233
Topographic map of Seymour Island from nonmetric aerial photographs [1984, eng] C-30794
Geocryogenic morphology at Seymour Island (Marambio) Antarctica: a progress report [1983, eng] E-29079
Mineralogical and physicochemical conditions of surface sediments on Seymour Island [1981, spa] E-29364
New marsupial from Seymour Island, Antarctic Peninsula [1983, eng] E-29577
Dinocyst biostratigraphy of Seymour Island [1982, eng] E-29857
Quaternary glacial marine deposits on Seymour Island [1983, eng] E-30252
Unusual periglacial features on Seymour Island, Antarctic Peninsula [1983, eng] E-30253
Changes in macrofossil faunas at the end of the Cretaceous on Seymour I. [1983, eng] E-30254
Upper Cretaceous to paleocene sedimentology and macropaleontology, Seymour I. [1983, eng] E-30255
Upper Cretaceous microfossil biostratigraphy of Seymour Island [1983, eng] E-30256
Geology and paleontology of Seymour Island [1984, eng] E-30561
Seymour Island yields a rich fossil harvest [1984, eng] E-30736
Seymour Island yields a rich fossil harvest [1984, eng] E-31188
Late Eocene molluscs from Seymour Island [1984, eng] E-31384

Shackleton Ice Shelf
Bottom contours near the Antarctic Peninsula and South Shetland Islands [1982, rus] E-28972
Surges of the Denman outlet glacier and their relations to the state of the Shackleton Ice Shelf in Antarctica [1983, rus] F-29936

Shackleton Range
First diagnostic stromatolites from Antarctica and their biostratigraphic significance [1980, rus] E-29426
Geochronological investigation of the Shackleton Range [1983, eng] E-29551
Structural stages of the Precambrian of the Shackleton Range [1983, eng] E-29552
Late Precambrian and Early Paleozoic history of the Shackleton Range [1983, eng] E-29553
Age determination in rocks from Shackleton Range and Whichaway Nunataks [1983, rus] E-29732
Stratigraphy and structure of the Lagrange Nunataks, northern Fuchs Dome and Herbert Mountains of the Shackleton Range [1984, eng] E-30113
Discovery of first Middle Cambrian trilobites in Shackleton Range [1984, eng] E-30645
Geology of the Shackleton Range: II. The Turnpike Bluff group [1983, eng] E-31042
Geology of the Shackleton Range: III. The Blaiklock Glacier group [1983, eng] E-31049

Shirase Glacier
Aeromagnetic survey over the Shirase Glacier [1983, eng] F-29112
Basal sliding of Shirase Glacier [1983, jpn] F-29218
Studies on the supraglacial lake located on the Shirase Glacier near the Okuhyoga Rock [1984, eng] F-31599
Surface meteorological data during oversnow traverse in 1982-1983 [1984, eng] I-30046
Submarine topography of Lützow-Holm Bay, Antarctica [1983, eng] J-29130

Showa Station
Japanese antarctic research, 1984 report [1984, eng] A-31011
DDT compounds and PCB isomers in Weddell seal [1983, eng] B-29073
Epipelagic copepods of Calanoida in the Indian Ocean [1982, eng] B-29379
Diving observations of the marine benthos at Showa Station, Antarctica [1982, eng] B-29382
Stomach contents in fish from Lützow-Holm Bay [1982, eng] B-29384
Moss photosynthesis and primary production at Showa Station [1983, eng] B-30179
Paralabidocera antarctica occurrence and age composition at Showa Station [1984, eng] B-30894
Fate of DDTs, PCBs and chlordane compounds in the antarctic marine ecosystem [1984, eng] B-30905
Soil bacteria at Showa Station and habitat conditions [1984, eng] B-30906
Mites around Showa Station [1984, jpn] B-31398
Activities of the summer party, 24th JARE, 1982-1983 [1984, jpn] D-30621
Ice sheet flow velocity, Showa to Mizuho Stations [1983, eng] F-29131
Misalignment of crystal axis of subgrains in Antarctic sea ice [1983, jpn] F-29317
Brine exclusion process from growing sea ice [1983, eng] F-29976
Station position, elevation and ice thickness between Syowa and Mizuho stations [1984, eng] F-30041
Noises in the east antarctic ice sheet [1984, eng] F-30103
Introduction to Showa Station—(5): Buildings [1983, jpn] G-29221
Floor-elevated summer quarters at Syowa Station [1983, eng] G-31546
Climatological features of Mizuho Station [1983, eng] I-29261
Modeling strong katabatic winds at Showa and Mizuho Stations [1983, eng] I-29265
Effective infrared emissivity of clouds in Antarctica [1983, eng] I-29267
Spectral extinction measurement by sunphotometer at Showa Station, Antarctica [1983, eng] I-29269
Characteristics of clouds at Showa Station [1983, eng] I-29270
Laser radar system for measuring the middle atmosphere [1983, jpn] I-29405
Satellite derivation of total atmospheric ozone [1984, eng] I-30124
Properties and origins of aerosol particles in the atmosphere [1983, jpn] I-30175
Environmental pollution of chlorinated hydrocarbons in the Antarctic [1984, jpn] I-31397
Oceanographic observations during the 22nd Japanese Antarctic Research Expedition [1982, eng] J-29376
Short-period magnetic pulsations and VLF emissions [1984, eng] K-29966
Upper atmosphere physics data, Syowa Station, 1981 [1984, eng] K-29980
Records of radio aurora at Showa Station [1984, eng] K-30034
Cosmic noise records from Showa Station, 1982 [1984, eng] K-30036
Report of the 1983 conjugate campaign in Iceland [1984, eng] K-30130
Harmonic structure of Pc 3-5 magnetic pulsations [1984, eng] K-30350
Auroral X-ray pulsations associated with VLF pulsations [1984, eng] K-30497
Operation plan for the Iceland-Syowa conjugate campaign in 1983-1985 [1984, eng] K-30498
Spatial-temporal characteristics of flickering spots in flickering auroras [1984, eng] K-30664
Band-limited ELF emission burst (auroral roar) [1985, eng] K-31591
Borehole tiltmeter observations at Showa Station [1983, eng] L-29114
Water tube tiltmeter at Showa Station [1983, eng] L-29115
Aeromagnetic surveys around Showa Station [1984, eng] L-29928
Seismological bulletin of Syowa Station, Antarctica, 1982 [1984, eng] L-29930
Crustal structure between Showa and Mizuho Stations [1984, eng] L-30100
Crustal structure and bedrock topography near Showa Station [1984, eng] L-30909
P and *S* waves in rocks near Showa Station [1984, eng] L-30911
Magnetic anomalies along the traverse route between Showa and Mizuho Stations [1984, eng] L-31597
Leveling and gravity surveys at Showa Station [1984, eng] L-31598

Signy Island
Organization of soil arthropod communities [1983, eng] B-29049
New species of *Notoficula* [1983, eng] B-29060
Diving depths of the chinstrap penguin *Pygoscelis antarctica* [1983, eng] B-29063
Desmids from Signy Island [1983, eng] B-29068
Life cycle of *Notothenia rossii* [1983, eng] B-29069
Benthic protozoa from marine antarctic freshwater lakes and pools [1984, eng] B-29398
Prosobranch gastropods from Signy Island [1984, eng] B-29400
Simple moss-turf communities patterns in South Georgia and Signy Island [1983, eng] B-29675
Spawning of the limpet *Nacella (patinigera) concinna* [1983, eng] B-30110

Signy Island *(cont.)*
Lipid content and composition of some antarctic macrozooplankton [1984, eng] B-30115
New species of mite in the genus *Nanorchestes* from Signy Island [1984, eng] B-30117
Energy partitioning in the antarctic collembolan *Cryptopygus antarcticus* [1984, eng] B-30165
Protozoa of Signy Island fellfields [1984, eng] B-30461
Comparative study of invertebrate supercooling at Signy Island [1984, eng] B-30463
Low temperature effects on micro-arthropods [1984, eng] B-30657
Arthropod communities in a maritime antarctic moss-turf habitat [1984, eng] B-30713
Microflora-microfauna interactions in moss peat decomposition [1983, eng] B-31066
Life cycle strategies in two antarctic Collembola [1984, eng] B-31090
Arthropod communities in the Signy Island moss-turf habitat [1984, eng] B-31097
Breeding biology of McCormick's skua *Catharacta maccormicki* at Signy Island [1984, eng] B-31119
Comparative breeding biology of Adélie and Chinstrap penguins at Signy Island [1985, eng] B-31262
Ecological and chemical investigations of lichens from South Georgia and the maritime Antarctic [1984, eng] B-31574
Paleomagnetic significance of the Foca nunataks [1983, spa] E-29482
Siple Coast
Changes in the Ross Ice Shelf dynamic condition [1984, eng] F-29210
Siple Station
Age difference between polar ice and trapped air bubbles [1984, eng] F-30724
Standing wave patterns in VLF hiss [1983, eng] K-29000
In situ measurements of transionospheric VLF wave injection [1983, eng] K-29001
Siple VLF transmitter signals outside the plasmapause [1983, eng] K-29411
VLF emissions from Siple Station [1983, eng] K-29472
Phase measurements of Siple's whistler mode signals [1984, eng] K-29743
Excitation of magnetostatic fluctuations by filamentation of whistlers [1984, eng] K-29746
Oscillating magnetic field shell [1984, eng] K-29965
Direct multiple path magnetospheric propagation [1984, eng] K-29967
Time series analysis of magnetospheric wave-particle interactions [1982, eng] K-30304
Temporal variations in the Siple Station conjugate area [1984, eng] K-30313
Morning Pi 1 and field aligned currents [1984, eng] K-30500
Siple 21- and 42-kilometer antennas: Measurement and performance [1983, eng] K-30952
Studies of the spectral broadening effect with the Siple VLF transmitter [1983, eng] K-30953
Observations of standing waves in VLF hiss over Siple Station [1983, eng] K-30954
Siple Station VLF two-frequency squelch experiments [1983, eng] K-30955
Conjugate magnetic pulsation studies at Siple, Roberval, and DE-1 [1983, eng] K-30956
Recent advances from studies of the Trimpi effect [1983, eng] K-30957
Suppression of natural VLF noise by whistlers [1983, eng] K-30958
Whistler-induced perturbations of broadcast band signals [1983, eng] K-30959
Variable frequency VLF signals in the magnetosphere: associated phenomena and plasma diagnostics [1985, eng] K-31264
DE 1 observations of Siple transmitter signals and associated sidebands [1985, eng] K-31691
New VLF method for studying burst precipitation near the plasmapause [1985, eng] K-31692
Skallen Hills
Petrography of a discordant metabasite from the Skallen Hills [1983, eng] E-29123
Skallevikhalsen Hills
Mg-Al skarn of the Skallevikhalsen Hills [1983, eng] E-29124
Skarvsnes Foreland
Pb composition in metamorphic rocks from Skarvsnes [1983, eng] E-29528
Unconsolidated deposits in the Langhovde and Skarvsnes areas [1983, eng] F-29128
Snow Hill Island
Argentine activities on Snow Hill Island, 1979-1981 [1983, spa] G-29481
Sobral Peninsula
Upper Jurassic fauna in the Antarctic Peninsula [1983, spa] B-29153
Sör Rondane Mountains
Reconnaissance survey of the Sör Rondane Mountains by JARE, 1984 [1984, jpn] C-30622
South Atlantic Ocean
Ranking of dissolution susceptibility of planktonic foraminifera [1983, eng] B-29289
Mark recapture method for estimation of minke whale population size [1982, eng] B-29782
Phytoplankton in the South Atlantic in November-December 1971 [1982, rus] B-29843
Phytoplankton from the southwestern Atlantic and Indian Oceans [1983, eng] B-30539
Low-molecular weight hydrocarbons from the Falkland Plateau [1983, eng] E-29862
Mineralogic variability of the uppermost mantle along mid-ocean ridges [1984, eng] E-30490
Tectonic reconstructions of the South Atlantic [1983, eng] E-30521
Paleogene oxygen isotope records for the subantarctic South Atlantic Ocean: DSDP sites 511 and 512 [1983, eng] E-30522
Coccolith biostratigraphy of Deep Sea Drilling Project leg 71 cores [1983, eng] E-30524
Bottom-current erosion in the South Atlantic sector of the southern ocean [1983, eng] J-29592
Two temperature sections through the South Atlantic and Weddell Sea [1982, eng] J-29663
Terrigenous deposits on the Maurice Ewing Bank [1984, eng] J-30471
Upper layer thermal structure in the Atlantic sector of the southern ocean [1984, eng] J-30884
South Georgia
Summer in the Antarctic among penguins, seals and whaling relics [1983, nor] A-30546
Invertebrates collected at the old whaling station, Grytviken, South Georgia [1983, eng] B-28984
Fish prey of the antarctic fur seal [1983, eng] B-29064
Fish population at South Georgia [1983, eng] B-29065
Food and habitat of *Notothenia rossii* [1983, eng] B-29066
South Georgian mosses [1983, eng] B-29067
Type specimen of the moss *Dicranum oleodictyon* Dix [1983, eng] B-29070
Benthonic fauna around South Georgia and South Sandwich Islands [1983, spa] B-29141
Analysis of plankton organisms on *Orcadas 05-75* [1983, spa] B-29143
Soil testate rhizopods of South Georgia [1983, eng] B-29204
Interspecific breeding in giant petrels at South Georgia [1982, eng] B-29206
Fauna of floating kelp rhizoids from the Subantarctic and the Patagonian shelf [1982, rus] B-29244
South Georgia reindeer [1983, ita] B-29247
Zooplankton community off South Georgia in the summer of 1973 [1982, eng] B-29380
Zoological observations, Royal Bay, South Georgia 1882-1883. Part 1 [1984, eng] B-29488
Simple moss-turf communities patterns in South Georgia and Signy Island [1983, eng] B-29675
Metabolism in marbled notothenia [1981, eng] B-29687
Homeothermy in petrels and prions [1983, eng] B-29720
Moult of giant petrels at South Georgia [1984, eng] B-29811
Distribution of hydrocarbons in the antarctic environment [1980, eng] B-29832
Muraenolepidae eggs and larvae from the Scotia Sea [1983, eng] B-29879
Stereochemistry of 7beta-Acetoxy-22-hydroxyhopane from a South Georgia lichen [1983, eng] B-29918
New species of *Echiodon* in the Antarctic [1983, eng] B-29931
Krill population off South Georgia in autumn [1984, eng] B-29949
Lipid content and composition of some antarctic macrozooplankton [1984, eng] B-30115
Synoptic flora of South Georgian mosses: *Grimmia* and *Schistidium* [1984, eng] B-30116
Characteristics of krill eaten by fur seals [1984, eng] B-30118

GEOGRAPHIC INDEX

Ice fish (Chaenichthyidae) in the South Atlantic [1982, ger] B-30155
Zoological observations, Royal Bay, South Georgia 1882-1883. Part 2: penguins [1984, eng] B-30187
Growth rates of antarctic fur seal *Arctocephalus gazella* pups at South Georgia [1984, eng] B-30277
Pup mortality in the fur seal at South Georgia [1984, eng] B-30301
Reproduction of "limbless" sole (Bothidae) in southwestern Atlantic [1981, eng] B-30321
Feeding of krill around South Georgia at different depth and time of day [1984, eng] B-30422
New variety of the moss *Tortula robusta* from South Georgia [1984, eng] B-30462
Reindeer effects on the flora and invertebrate fauna of South Georgia [1984, eng] B-30550
Age determination of *Notothenia rossii* from South Georgia [1984, eng] B-30587
Temperature effect on *Candida saké* growth [1984, eng] B-30597
Hyadesia maxima sp. n. (Acari, Hyadesiidae) from South Georgia [1983, eng] B-30617
Oxygen consumption of five species of fish from South Georgia [1984, eng] B-30658
Micro-arthropod and plant species associations [1984, eng] B-30661
Activity budgets of foraging Gray-headed Albatrosses [1984, eng] B-30662
Fur seal research at Bird Island, South Georgia [1983, eng] B-30685
Ecophysiology of two intertidal mites at South Georgia [1984, eng] B-30714
Plant colonization of actively sorted stone stripes in the Subantarctic [1984, eng] B-30734
Biomass estimates of commercial fish off South Georgia [1984, eng] B-30783
Observations on gills of pelagic and demersal juvenile *Notothenia rossii* [1984, eng] B-31120
Fur seal diving behavior in relation to vertical distribution of krill [1985, eng] B-31446
Movements of giant petrels ringed at South Georgia [1984, eng] B-31471
Phytoplankton drift transport and distribution in the vicinity of South Georgia Island [1984, eng] B-31511
Some peculiarities of distribution and feeding of *Notothenia guentheri* (Nototheniidae) [1983, eng] B-31571
Physiological-biochemical peculiarities of gonad maturation of marbled notothenia, *Notothenia rossi marmorata* (Nototheniidae) [1983, eng] B-31572
Ecological and chemical investigations of lichens from South Georgia and the maritime Antarctic [1984, eng] B-31574
Breeding biology of Wilson's storm petrel on Bird Island [1985, eng] B-31580
Parthenogenetic midge on South Georgia [1985, eng] B-31582
Annual food requirements of seabirds at Bird Island [1984, eng] B-31590
Reproductive biology of an antarctic shrimp [1983, eng] B-31751
Periglacial activity on the subantarctic island of South Georgia [1983, eng] E-29133
Geology of South Georgia: V. Drygalski Fjord complex [1983, eng] E-29402
Structure of two South Georgia rock glaciers [1982, eng] E-29846
Morphology and environment of some periglacial features on South Georgia [1984, eng] E-30459
Lower Cretaceous bivalve biostratigraphy of Antarctica [1983, eng] E-30660
British Antarctic Territory geological map, scale 1:500,000; South Orkney Islands, with South Georgia and South Sandwich Islands [1984, eng] E-30745
Geology of Ducloz Head area, South Georgia [1983, eng] E-31038
Intrusive rocks of the Larsen Harbor Formation [1983, eng] E-31041
Geology of north-western South Georgia: IV. Structural geology [1983, eng] E-31045
Summer heat and ice balances on Hodges Glacier, South Georgia [1982, eng] F-29844
On late-glacial and holocene glacier fluctuations in maritime West Antarctica [1983, eng] F-29863
Glacier fluctuations in South Georgia, 1883-1974 [1983, eng] F-31039
Investigation of origin of krill found off South Georgia [1983, rus] J-29090
Ionospheric F2 region particle precipitation near South-Atlantic magnetic anomaly [1982, eng] K-30575

South Orkney Islands
  Summer in the Antarctic among penguins, seals and whaling relics [1983, nor] A-30546
  Moneta's years in the South Orkney Islands [1984, spa] A-31244
  Type specimen of the moss *Dicranum oleodictyon* Dix [1983, eng] B-29070
  Supercooling and winter survival in terrestrial arthropods [1982, eng] B-29955
  Terrestrial arthropoda of the grasses on Lynch Island [1984, eng] B-31091
  Krill food supply and phytophaga in Scotia Sea [1985, rus] B-31666
  Mélange on Fredriksen Island, South Orkneys [1983, eng] E-29110
  British Antarctic Territory geological map, scale 1:500,000; South Orkney Islands, with South Georgia and South Sandwich Islands [1984, eng] E-30745
  Late Mesozoic, non-marine conglomeratic sequences of northern Antarctic Peninsula (the Botany Bay Group) [1984, eng] E-31115
  Si/P ratio as indicator of mixing zone [1982, rus] J-28975

South Pacific Ocean
  Distribution patterns of lichens in the Pacific Region [1983, eng] B-29205
  Trophogenic-layer stability as indicator of spatial heterogeneity in the Pacific [1984, eng] B-29944
  Hydrochemical conditions in areas of krill concentrations in Scotia Sea and the South Pacific [1984, eng] B-29946
  Zoogeographic partition of the southern Pacific surface waters by macroplankton [1982, rus] B-31317
  High latitude climates of the Pacific [1983, eng] I-29831
  Distribution of krill clusters in the Pacific [1983, rus] J-29089
  Miocene stable isotope stratigraphy and paleoceanography [1981, eng] J-29963
  Meridional heat transport in the Pacific Ocean [1984, eng] J-30091
  Tectonic evolution of the Pacific Ocean since 74 Ma [1983, eng] J-31131
  Applications of satellite altimetry to oceanography and geophysics [1984, eng] J-31718
  Austral and antarctic geopolitics [1985, spa] M-31418

South Pole
  Measurements of hydrogen peroxide in polar ice samples [1984, eng] F-31460
  Studies of atmospheric energy transfer processes at the South Pole [1983, eng] I-30704
  Rare trace gases at the South Pole [1983, eng] I-30705

South Sandwich Islands
  Benthonic fauna around South Georgia and South Sandwich Islands [1983, spa] B-29141
  Analysis of plankton organisms on *Orcadas 05-75* [1983, spa] B-29143
  British Antarctic Territory geological map, scale 1:500,000; South Orkney Islands, with South Georgia and South Sandwich Islands [1984, eng] E-30745

South Shetland Islands
  Archaeological investigations in Antarctica [1983, spa] A-29303
  King George and Elephant islands [1985, por] A-31628
  Large snow petrels on the South Sandwich Islands [1983, eng] B-29097
  Spawning frequency and fecundity of krill [1983, eng] B-29147
  Morphology and taxonomy of freshwater copepods on South Shetland Islands [1983, spa] B-29159
  Imperfect albinism in *Arctocephalus gazella* (Peters, 1875) on South Shetland Islands [1983, spa] B-29298
  Estimate of the number of penguins on the South Shetland Islands [1983, spa] B-29304
  Penguin census on Ardley Island [1983, spa] B-29305
  Benthic algae of South Shetland Islands [1983, spa] B-29306
  Bottom trawl fishing off South Shetland Islands [1982, eng] B-29383
  Biology of Paraliparis of the South Shetlands [1981, eng] B-29834
  Food of fish around the Antarctic Peninsula [1981, eng] B-29836
  Sexual reproduction in algae [1984, spa] B-30604
  Chilean study of seals [1984, spa] B-30606
  Zoological studies in the area of Bellingshausen Station [1984, rus] B-30850
  Antarctic acanthocephalans of the genus *Metacanthocephalus* [1983, eng] B-31125
  Structures of swarming and dispersed krill populations [1984, eng] B-31195
  Aspects of schooling in *Euphausia superba* [1984, eng] B-31196
  Development and growth in krill larvae [1984, eng] B-31207

South Shetland Islands *(cont.)*
- Bottom contours near the Antarctic Peninsula and South Shetland Islands [1982, rus] E-28972
- Morphology of lenitic environment on Potter Peninsula [1983, spa] E-29136
- Lateral migration of island arc volcanism, South Shetland Islands [1983, eng] E-29223
- Scotia metamorphic complex at Cape Bowles [1983, spa] E-29301
- Mistaken antarctic origin of two projectile points [1983, spa] E-29302
- Slopes, hillsides, and walls on the Antarctic Peninsula [1983, ger] E-29514
- Spores, pollen, and microplankton from the South Shetlands [1983, eng] E-29572
- Geochemistry of igneous activity in the South Shetlands [1983, eng] E-29584
- Composition, origin, and tectonics of some blueschist clinopyroxenes [1983, eng] E-29586
- Geologic study of South Shetland Islands [1983, eng] E-29673

Rock glaciers in southern Victoria Land [1983, eng] **E-28983**
Discovery of the first lunar meteorite [1983, eng] **E-29008**
Origin of lunar meteorite [1983, eng] **E-29010**
Petrology of ALHA 81005 [1983, eng] **E-29011**
ALHA 81005: Moon, Mars, petrography, and Giordano Bruno [1983, eng] **E-29012**
Meteorite ALHA 81005: petrology of a new lunar highland sample [1983, eng] **E-29013**
Oxygen and silicon isotopes in ALHA 81005 [1983, eng] **E-29014**
Noble gases in lunar meteorite [1983, eng] **E-29015**
Recent cosmic ray exposure history of ALHA 81005 [1983, eng] **E-29016**
Ferromagnetic resonance and magnetic properties of ALHA 81005 [1983, eng] **E-29017**
Thermoluminescence and nuclear particle tracks in ALHA 81005 [1983, eng] **E-29018**
Possible lunar source areas of meteorite ALHA 81005 [1983, eng] **E-29019**
ALHA 81005 a piece of ancient lunar crust [1983, eng] **E-29020**
Siderophile, lithophile and mobile trace elements in the lunar meteorite Allan Hills 81005 [1983, eng] **E-29021**
ALHA 81005 meteorite: chemical evidence for lunar highland origin [1983, eng] **E-29022**
ALHA 81005 and lunar anorthositic norites [1983, eng] **E-29023**
Geochemistry and the lunar origin of ALHA 81005 [1983, eng] **E-29024**
Composition of Allan Hills A81005 [1983, eng] **E-29025**
Cenozoic glaciation in southern Victoria Land [1983, eng] **E-29078**
Pre-Beacon geology of northern Victoria Land: a review [1983, eng] **E-29536**
Metamorphism and deformation in northern Victoria Land [1983, eng] **E-29540**
Post-Ross Orogeny Cratonization of northern Victoria Land [1983, eng] **E-29543**
Carboniferous granitoids of northern Victoria Land [1983, eng] **E-29544**
Granites and two orogenies of southern Victoria Land [1983, eng] **E-29548**
Trace fossils of the Takrouna formation, Victoria Land [1983, eng] **E-29558**
Geological map of coal formations, south Victoria Land [1983, eng] **E-29560**
Isotope and chemical variations in Kirkpatrick Basalt Group [1983, eng] **E-29561**
Petrology of Marie Byrd Land and Victoria Land [1983, eng] **E-29569**
Petrological study of Kirkpatrick Basalt, Victoria Land [1983, eng] **E-29703**
Geochemistry of Cambrian volcanics of the Bowers Supergroup [1984, eng] **E-29858**
Tectonics of some Paleozoic fossils of northern Victoria Land [1984, eng] **E-29916**
Lawrence Peaks volcanics, North Victoria Land [1984, eng] **E-30150**
Hydrocarbon exploration of Ross Sea basins from geophysical data modelling [1984, eng] **E-30177**
Geological investigations of portions of northern Victoria Land [1983, eng] **E-30224**
Geological observations on the Kirkpatrick Basalt in the Mesa Range region, northern Victoria Land [1983, eng] **E-30226**
Petrogenesis of the Kirkpatrick Basalt, Solo Nunatak, northern Victoria Land [1983, eng] **E-30227**
Jurassic trees engulfed by lavas of the Kirkpatrick Basalt Group [1983, eng] **E-30228**
Discovery of a Tertiary granite pluton, northern Victoria Land [1983, eng] **E-30229**
Brachiopods with Australian and New Zealand affinities in the Spurs Formation [1983, eng] **E-30230**
Sedimentary petrology of Permian-Triassic rocks in Allan Hills [1983, eng] **E-30231**
Volcanic geology of Turks Head, Tryggve Point, and Minna Bluff [1983, eng] **E-30237**
Youngest Cambrian or oldest Ordovician fossils from Robertson Bay [1984, eng] **E-30427**
Slope processes in South Victoria Land [1984, eng] **E-30737**
N-15 abundance in the Dry Valley area with microorganism implications [1984, eng] **E-30903**
Field and laboratory investigations of meteorites from Victoria Land, Antarctica [1984, eng] **E-30997**
1980-1981 field season [1984, eng] **E-30998**
Field season in Victoria Land, 1981-1982 [1984, eng] **E-30999**
Ablation and ice movement at the Allan Hills Main Icefield between 1978 and 1981 [1984, eng] **E-31000**
Description of stony meteorites [1984, eng] **E-31001**
Descriptions of iron meteorites and mesosiderites [1984, eng] **E-31002**
Petrology and classification of 145 small meteorites from 1977 Allan Hills collection [1984, eng] **E-31003**
Classification, metamorphism, and brecciation of type 3 chondrite from Antarctica [1984, eng] **E-31004**
Meteorite from the Moon [1984, eng] **E-31005**
Cosmic-ray-produced nuclides in Victoria Land meteorites [1984, eng] **E-31006**
Bulk chemical analyses of antarctic meteorites, with notes on weathering effects on FeO, Fe-metal, FeS, H2O, and C [1984, eng] **E-31007**
Suspect terranes in North Victoria Land [1984, eng] **E-31368**
Origin of epigenic coal from Antarctica and Ohio [1984, eng] **E-31452**
Ice mass fluctuations in northern Victoria Land [1983, eng] **F-30403**
Thickness of ice on perennially frozen lakes [1985, eng] **F-31687**
Radar wave speeds in polar glaciers [1983, eng] **G-29099**
Environmental radioactivity in Antarctica [1984, jpn] **I-31257**
Bathymetry of the North Victoria Land continental margin [1983, eng] **J-28994**

Victoria Valley
Preliminary abrasion rate observations in Victoria Valley, Antarctica [1983, eng] **E-30233**

Vostok Station
Fire at Vostok Station [1984, eng] **A-30665**
Deep down south [1984, eng] **A-31153**
Vostok Station paleoclimate from isotopic core studies [1980, rus] **F-29417**
Anomalous isotopic composition of hydrogen in the snow cover of central Antarctica [1979, rus] **F-30332**
Study of the granulometric composition of ice core trace elements at Vostok Station by an electrooptical method [1984, rus] **F-30866**
Use of snow airfields in Antarctica for determination of accumulation rate and atmospheric precipitation [1985, rus] **F-31660**
Density and rheological properties of glacier ice [1985, rus] **F-31661**
Strategy of psychological adaptation under Antarctic conditions [1984, rus] **H-30943**
Soluble and insoluble impurities in Vostok ice core and climatic implications [1984, eng] **I-30933**

Weddell Sea
Shackleton's antarctic writings [1983, eng] **A-30752**
Krill in the Scotia Sea [1983, rus] **B-29091**
New Cretaceous asteroidea from Vicecomodoro Marambio Island [1983, spa] **B-29154**
Eggs and larvae of two krill species [1983, eng] **B-29342**
Protists from the ice-edge region of the Weddell Sea [1983, eng] **B-29513**
Distribution of euphausiid larvae in the southern Weddell Sea [1982, eng] **B-29665**
Population composition of krill *Euphausia superba* Dana [1984, eng] **B-29947**
Physical mechanism for establishing algal populations in frazil ice [1983, eng] **B-29968**
Nutrient depletion indicates high primary productivity in the Weddell Sea [1984, eng] **B-30298**
Dark fixation of CO2 in the subtropical North Pacific Ocean and the Weddell Sea [1983, eng] **B-30355**
Morphology and ecology of diatoms in sea ice from the Weddell Sea [1984, eng] **B-30357**
Studies of ice-algal communities in the Weddell Sea [1983, eng] **B-30536**
Relative abundance of diatoms in Weddell Sea pack ice [1983, eng] **B-30537**
Contribution to the fish fauna of Weddell Sea [1984, eng] **B-30716**
Siliceous microfauna in waters beneath antarctic sea ice [1984, eng] **B-31241**
Phytoplankton drift transport and distribution in the vicinity of South Georgia Island [1984, eng] **B-31511**
Postlarval notothenioids [1984, eng] **B-31698**
Life of *Pleuragramma antarcticum* Boul. 1902 (Pisces, Nototheniidae) in the Weddell Sea [1983, eng] **B-31701**
Occurrence and distribution of the antarctic copepods along the ice shelves in the Weddell Sea in summer 1979-1980 [1983, eng] **B-31702**
Sea ice algal communities in the Weddell Sea [1983, eng] **B-31747**

Weddell Sea *(cont.)*
Glaciomarine sediments and suspended matter, Weddell Sea [1983, eng] E-29041
New geophysical and geological data in the Weddell Sea [1983, eng] E-29120
Geology of the Antarctic Peninsula and adjacent islands [1983, spa] E-29173
Structure and outline of geologic history of the southern Weddell Sea basin [1983, eng] E-29554
Glacigenic marine sediments in Weddell Sea [1984, eng] E-30145
Petrologic study of Weddell Sea sediments [1984, eng] E-30472
Marine geophysical work during Antarctic II/4 [1984, eng] E-31163
Marine geology and bottom profiling of the Weddell Sea [1984, eng] E-31164
Antarctic sea ice microwave signatures [1984, eng] F-29232
Sea ice and biological activity in the Antarctic [1984, eng] F-29745
Elemental compositions and concentrations of microspherules in snow and pack ice from the Weddell Sea [1983, eng] F-30514
Sea ice data buoys in the Weddell Sea [1984, eng] F-30569
Ice dynamics [1984, eng] F-30815
Sea ice brightness temperatures in the Weddell Sea [1984, eng] F-31068
Sea ice variations in the Weddell Sea [1983, eng] F-31535
Variations in the sea ice edge in the Weddell Sea [1985, ger] F-31610
US/USSR Weddell Polynya expedition, Upper air data, 1981 [1983, eng] I-30352
Drag coefficient across the Antarctic marginal ice zone [1984, eng] I-30549
Variability of atmospheric circulation at the surface of the South Pacific Ocean in summer [1984, eng] I-31104
Atmospheric circulation and formation of Weddell polynya [1985, rus] I-31650
Hydrology of Bransfield Strait and krill distribution [1983, rus] J-29092
Nonlinear model of mesoscale ocean circulation [1983, rus] J-29503
Erosion and morphology of the Weddell Sea shelf [1983, eng] J-29611
Two temperature sections through the South Atlantic and Weddell Sea [1982, eng] J-29663
Carbonate chemistry of the Weddell Sea [1984, eng] J-29975
Weddell Gyre [1983, eng] J-30517
Distributions of dissolved calcium and alkalinity in the Weddell Sea in winter [1983, eng] J-30518
Weddell polynya as a consequence of hydrophysical processes in the Weddell circulation [1984, rus] J-30552
Physical oceanography of the eastern Scotia Sea [1984, eng] J-30596
Characteristics of a salinity front in the eastern Bransfield Strait, the source region of the Weddell-Scotia Confluence [1983, ger] J-31094
Regional aeromagnetic survey of the northwestern Weddell Sea, Antarctica [1984, eng] J-31234
Late winter chlorophyll *a* distributions in the Weddell Sea [1984, eng] J-31240

West Antarctica
Glacial marine sedimentation model from antarctic Quaternary deposits [1983, eng] E-29199
Larsen Rift: an active extension fracture in West Antarctica [1983, eng] E-29582
Ice-age simulations with a calving ice-sheet model [1983, eng] F-29789
Model of interactions between ice stream, ocean and solid ground in West Antarctica [1983, eng] F-30437
Because a large part of the inland ice in West Antarctica lies on a bed far below sea level, the ice sheet is theoretically capable of an unstable and rapid shrinkage. [1983, eng] F-31427
Potential CO2-induced changes in West Antarctica [1984, eng] I-31102
Precipitation regime of the west antarctic ice sheet [1984, eng] I-31108
Temperatures of West Antarctica compared to those of other antarctic regions [1984, eng] I-31109
Deep seismic studies in West Antarctica [1982, eng] L-28991
Magnetic studies of upper crustal structure in West Antarctica and the boundary with East Antarctica [1983, eng] L-29555

Whichaway Nunataks
Age determination in rocks from Shackleton Range and Whichaway Nunataks [1983, rus] E-29732

White Island
Nutrient influx and seal population at White Island [1984, eng] B-29716

Wilkes Land
Structural geology interpretations of Wilkes Land [1983, eng] E-29625
Snow stratigraphy in katabatic wind region of Wilkes Land [1983, eng] F-29817

Wilkins Coast
Geology of parts of the Wilkins and Black Coasts, Palmer Land [1984, eng] E-31077

Windless Bight
Final progress report for Contract F49620-81-C-0091 [1982, eng] I-29856
Infrasonic signal detection array at Windless Bight [1983, eng] K-29704

Windmill Islands
Reassessment of the age of the Windmill Metamorphics, Casey area [1983, eng] E-29532

Wisconsin Range
Rb-Sr provenance dates of feldspar in glacial deposits of the Wisconsin Range, Transantarctic Mountains [1983, eng] E-29238

Wright Valley
Halotolerance of micro-organisms isolated from saline dry valley soils [1983, eng] B-30691
Provenance dates of feldspar in Wright Valley [1983, eng] E-29604
Using soils to study McMurdo area ice thickness [1983, eng] E-29605
Origin of salts in antarctic saline lake waters [1984, eng] E-30925
Hydrology and glaciology of the dry valleys, 1980-81 [1983, eng] E-30996
Paleomagnetism of the Wright Valley basement complex [1984, eng] E-31688
Ammonia and ammonium concentrations in the antarctic atmosphere [1983, eng] I-31632
